Teacher's Introduction

This resource consists of four brand-new, complete sets of A Level Practice Papers and mark schemes for the AQA Design and Technology: Product Design (7552) specification. There are two sets of Practice Papers provided for Paper 1, and two sets of Practice Papers provided for Paper 2. The papers are closely aligned to the AQA sample assessment materials.

The four sets of papers are accompanied by a specification coverage grid to show where and how each question is mapped against the specification. The very large majority of the specification has been covered across the four sets of papers.

These papers will be a great resource for teachers as they prepare their students for public examinations. They can be marked using the comprehensive mark schemes, and feedback can be provided to help improve students' exam technique and to help diagnose the students' strengths and weaknesses.

The papers assess the technical principles and the designing and making principles. Maths skills are also assessed across both papers.

These papers can be used in parts for homework after specific areas of the specification have been taught, or they can be used in full for mock exams or for revision purposes.

The papers can be completed individually or in small groups. Students can then mark the papers themselves so that they can see how the mark schemes are applied and set out to further improve their own understanding of the exam itself.

Students' confidence will improve by completing these practice exam papers knowing that they will have been tested on content from across all major areas of the specification.

Update v1.1, 17 February 2022

- New questions added (Q15–17) to make Paper 1.1 total 80 marks
- Questions changed/replaced (mark schemes updated): 1.1 Q12, 1.2 Q3, 1.2 Q6, 2.2 Q4, 2.2 Q9
- Mark schemes corrected to better match the questions: 1.1 Q14, 1.2 Q5, 2.1 Q2, 2.1 Q3, 2.2 Q12
- Mark schemes made more comprehensive throughout.

Remember!

Always check the exam board website for new information, including changes to the specification and sample assessment material.

April 2020

Specification Coverage Grid

Paper 1: 3.1 Technical Principles

Subject Content	
3.1.1 Materials and their applications	Classification of materials
	Methods for identification and testing materials
3.1.2 Performance characteristics of materials	Performance characteristics of papers and boards
	Performance characteristics of polymer based sheet and film
	Performance characteristics of woods
	Performance characteristics of metals
	Performance characteristics of polymers
	Elastomers
	Biodegradable polymers
	Composites
	Smart materials
	Modern materials
3.1.3 Enhancement of materials	Polymer enhancement
	Wood enhancement
	Metal enhancement
3.1.4 Forming, redistribution and addition processes	Paper and board forming processes
	Polymer processes
	Metal processes
	Wood processes
3.1.4.5 The use of adhesives and fastenings and fixtures	Adhesives and fastenings and fixtures
3.1.5 The use of finishes	Paper and board finishing
	Paper and board printing processes
	Polymer finishing
	Metal finishing
	Wood finishing

INSPECTION COPY

COPYRIGHT
PROTECTED

Subject Content	
3.1.6 Modern industrial and commercial practice	Scales of production
3.1.6.2 Efficient use of materials	Efficient use of materials
	The use of computer systems
	Sub-assembly
3.1.7 Digital and smart manufacture	Computer-aided design (CAD)
	Computer-aided manufacture (CAM)
	Virtual modelling
	Rapid prototyping processes
	Electronic data interchange
3.1.8 The requirements for product design and development	Production, planning and control (PPC) networking
	Product development and improvement
3.1.9 Health and safety	Inclusive design
	Safe working practices
3.1.10 Protecting designs and intellectual property	Safety in products and services to the customer
	Protecting designs and intellectual property
3.1.11 Design for manufacturing, maintenance, repair and disposal	Manufacture, repair, maintenance and disposal
	Ease of manufacture
	Disassembly
3.1.12 Feasibility studies	Feasibility studies
3.1.13 Enterprise and marketing in the development of products	Enterprise and marketing in the development of products
3.1.14 Design communication	Design communication

Paper 2: 3.2 Designing and Making Principles

Subject Content	
3.2.1 Design methods and processes	Iterative design process
3.2.2 Design theory	Design influences
	Design styles and preferences
	Designing and their work
3.2.3 How technology and culture can impact on the work of designers	Socio-economic influences
	Major developments in technology
	Social, moral and ethical issues
3.2.3.4 Product development	Product life cycle
3.2.4 Design processes	The use of a design process
	Prototype development
	The iterative design process in industrial or commercial contexts
3.2.5 Critical analysis and evaluation	Testing and evaluating products in commercial products
	Use of third party feedback in the testing and evaluation process
3.2.6 Selecting appropriate tools, equipment and processes	Selecting appropriate tools, equipment and processes
3.2.7 Accuracy in design and manufacture	Accuracy in design and manufacture
3.2.8 Responsible design	Environmental issues
	Conservation of time and resources
	Conservation of energy and efficiency
3.2.9 Design for manufacture and production management	Quality assurance
	Quality control
3.2.10 National and international standards in product design	National and international standards in product design

A Level
Design and Technology Product Design

Paper 1: Technical Principles

Set 1

Name	
------	--

Time allowed: 2 hours and 30 minutes

Materials required:

- Writing and drawing instruments
- A calculator

Instructions:

- Use black ink or black ballpoint pen. Use pencil only for drawing.
- Answer **ALL** the questions.

Information:

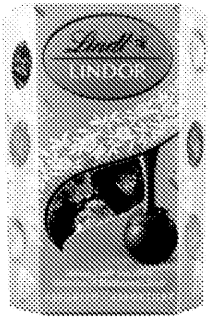

- The number of marks available for each question is shown in brackets.
- The maximum number of marks available for this paper is 120.

Qu.	Marking guidance	
21	Marks	Description
	7-9	An excellent discussion demonstrating a high level of analysis, comparison of the two different types of manufacturing, with reference to CAM and traditional manufacturing methods, consideration of their suitability and use within the context.
	4-6	A good discussion demonstrating a sound degree of analysis, comparison of the two different types of manufacturing, with reference to CAM and traditional manufacturing methods, consideration of their suitability and use within the context.
	1-3	A basic response with some comparison of the two different manufacturing methods, with specific reference to CAM and traditional manufacturing methods. Limited consideration of their suitability and use within the context.
	0	No relevant content.
	<p>Relevant content:</p> <ul style="list-style-type: none"> • CAM machines can be linked directly to CAD packages so that designs can be made quite easily • CAM can run repeatedly without the need for breaks / stops / having to change working conditions • CAM machines have automatic tool changing heads so that a multitude of tools can be swapped in and out of the cutting head • CAM machines have multiple axes, which means complex shapes / 3D surface profiles can be machined • CAM machines of this complexity would be very expensive to purchase • Cutting fluids will be present in both traditional and automated milling. In an enclosed and shielded CAM machinery does reduce risks of clashes and harming an operator • Less about running machines repeatedly for a batch of 15 and more about adjusting speeds and feeds – to achieve desired accuracy and surface finish <p>Traditional manufacturing methods:</p> <ul style="list-style-type: none"> • Great skill and training is required to be able to machine components of this shape • They would take a great deal of time to cut, and may take several days to set up tools and changing cutters • The parts may be cut in stages to reduce the number of tool changes, but the setting and repositioning of components may result in inaccuracies being introduced • The use of cutting fluids may present health and safety issues for the worker. With a CAM machine it would be totally enclosed, reducing any potential risk to the worker
