Questions	
Cardiovascular System 1	<p>2. Define the terms 'coronary heart disease', 'high blood pressure', 'high cholesterol', 'stroke', 'atherosclerosis' and 'angina'.</p>
	<p>Coronary heart disease: a narrowing of the arteries. This stops blood from reaching the heart.</p> <p>High blood pressure: a blood pressure that is too high for the heart.</p> <p>High cholesterol: an excess of cholesterol in the blood, which can lead to coronary heart disease when it builds up in the arteries.</p> <p>Stroke: the restricted or cut off of blood to the brain because of oxygen starvation.</p> <p>Atherosclerosis: a build-up of fatty deposits in the arteries, which can block blood through the coronary arteries.</p> <p>Angina: the pain felt in the chest due to blockages and narrowed arteries.</p>
	<p>3. For each of the four health issues, describe how exercise can reduce the risk of the health concern occurring.</p>
	<p>Coronary heart disease: Exercise can help to keep the heart and blood vessels healthy.</p>
	<p>High blood pressure: Exercise can help to lower blood pressure.</p>
	<p>Cholesterol build-up: Exercise can help to lower cholesterol levels.</p>
	<p>Stroke: Exercise can help to keep the blood vessels healthy and prevent blockages.</p>

Questions			
Cardiovascular System 1	 <p>Fill in the terms 'heart rate', 'stroke volume' and 'cardiac output'.</p>	Heart rate:	the number of beats per minute
		Stroke volume:	the amount of blood pumped out of the heart per beat
		Cardiac output:	the amount of blood pumped out of the heart per minute
	5. How is maximal heart rate of an individual estimated?	Maximal heart rate (HR_{max})	
	6. Write an equation to calculate cardiac output.	Cardiac output (ml/min) = $HR \times SV$	
	 <p>7. Fill in the grid on the right, identifying the correct average resting values for an average untrained individual (heart rate, stroke volume and cardiac output). Would the values increase or decrease in a trained individual?</p>	Variable	
		Heart rate	
		Cardiac output	
		Stroke volume	
	 <p>8. Fill in the table, identifying the correct average values for an average individual (heart rate, stroke volume and cardiac output) during submaximal exercise.</p>	Values	At Rest
		Heart rate (bpm)	70
		Stroke volume (ml)	70
		Cardiac output (ml/min)	4900

Cardiovascular System 1	Questions			
	 <p>In the table, identifying the correct average values for an average individual (heart rate, stroke volume and cardiac output) during maximal exercise.</p>	Values	At Rest	
		Heart rate (bpm)	70	
		Stroke volume (ml)	70	
		Cardiac output (ml/min)	4900	
	10. What is meant by the term 'anticipatory rise'?	The increase in heart rate in anticipation of exercise. It		
	 <p>11. Explain how the vascular shunt mechanism regulates blood flow depending on exercise intensity</p>	<p>When exercising, more blood is directed to the muscles than delivering blood to other organs. Therefore, the body contracts blood vessels that blood is not needed, a process called vasoconstriction. Vasoconstriction is the narrowing of blood vessels.</p>

Questions		
Cardiovascular System 1	 <p>12. Explain the process of diastole.</p>	<p>Diastole is the heart relaxing or the lungs (oxygenated) aided by the atrioventricular travelling out of the atria. is higher than that in the ventricles.</p>
	<p>13. During systole, blood is ejected from the ventricles through which arteries? State what each artery takes the blood.</p>	<p>The aorta takes blood from the left ventricle. The pulmonary artery takes blood from the right ventricle.</p>
	<p>14. The heart is able to contract during its beating. Which feature causes an electrical impulse to start in the heart muscle cells?</p>	<p>Sinoatrial node</p>
	 <p>15. What does the impulse cause to happen in the atria?</p>	<p>The impulse causes the atria to contract.</p>
	<p>16. Which heart feature does the impulse travel to next? What is its function?</p>	<p>The AV node. The AV node allows blood to flow from the atria to the ventricles with blood before the impulse reaches the ventricles.</p>
	<p>17. Fill in the missing words.</p>	<p>Once the ventricles have contracted, the blood is pumped into the <u>aorta</u> which separates into <u>left</u> and <u>right</u> branches.</p>
	 <p>18. State the effect the Purkinje fibres have on the ventricles.</p>	<p>The Purkinje fibres cause the ventricles to contract and pump the electrical impulse.</p>

COPYRIGHT
PROTECTED

Cardiovascular System 1	Questions	
	19. Explain what happens to the electrical impulse having completed its circuit after the heart.	The heart relaxes, filling with blood, the process of a heartbeat.
	20. Describe and explain how the heart rate of a long-distance runner is regulated by neural factors during competition.	Neural factors regulate blood pressure and change heart rate; they are reported by proprioceptors respectively, impulses to either increase or decrease parasympathetic (decrease heart rate).
	21. How does the body regulate heart rate when increased concentrations of carbon dioxide are present in the blood during exercise?	During exercise, there are increased concentrations of carbon dioxide. The increased concentration of carbon dioxide stimulates chemoreceptors, which stimulate an increase in heart rate, helping to remove carbon dioxide from the blood.
	22. What is the role of baroreceptors, and how do they regulate blood flow during exercise?	Baroreceptors detect changes in blood pressure. The baroreceptors stimulate the heart rate to deliver more blood to the muscles during exercise.
	23. Describe the role of proprioceptors and explain how they change heart rate during exercise.	Proprioceptors detect movement and position. They stimulate the medulla oblongata to stimulate the heart rate to increase during exercise.

Cardiovascular System 2: Oxygen Transport, Venous Return and Arteriovenous Oxygen Difference

Questions		
Cardiovascular System 2	1. What is the name of the protein in red blood cells that can transport oxygen to the working muscles?	Haemoglobin
	2. What is the name of the protein that transports oxygen within muscle cells?	Myoglobin
	3. Explain the process of oxygen dissociation from haemoglobin	In areas where the partial pressure of oxygen is low, haemoglobin has a greater affinity for oxygen and can absorb more oxygen from the lungs. In areas where the partial pressure of oxygen is high, haemoglobin releases oxygen to the tissues.
	4. A graph of oxygen saturation of the haemoglobin at rest and during recovery would show a shift of direction of the graph curve. In which direction does the shift occur and what is this called?	Shift to the right = Bohr effect

INSPECTION COPY

COPYRIGHT
PROTECTED

Question		
Cardiovascular System 2	 <p>5. Draw an approximate graph to show this shift. Remember to label your axes correctly.</p>	
	 <p>Describe three factors that are responsible for the increase in the dissociation of oxygen from haemoglobin.</p>	<ol style="list-style-type: none"> 1. Acidity (pH) of blood. A lower pH of the blood. A lower pH causes oxygen to be released from the haemoglobin. 2. Partial pressure of carbon dioxide. A higher rate when the partial pressure of carbon dioxide is higher. 3. Blood temperature. During exercise, oxygen is released from the haemoglobin.

Question		
Cardiovascular System 2	<p>10. Using the graph below, describe cardiovascular drift.</p> 	<ul style="list-style-type: none"> Cardiovascular drift is a sustained steady-state response to heat stress. <ul style="list-style-type: none"> continued decrease in stroke volume small increase in heart rate progressive increase in cardiac output This process occurs because fluid loss results in a decrease in stroke volume and, therefore, venous return. For cardiac output to remain constant, heart rate needs to increase to compensate for the decrease in stroke volume ($\text{cardiac output} = \text{stroke volume} \times \text{heart rate}$). The body attempts to maintain a constant temperature.
	<p>11. Describe arteriovenous oxygen difference ($A-VO_2$ difference)</p>	<p>Gas exchange at the muscles. The arteriovenous difference is the difference in oxygen between the arterial and venous blood in the muscles.</p>

COPYRIGHT
PROTECTED

	Question	
Cardiovascular System 2	 <p>12. Describe how arteriovenous oxygen difference changes in response to exercise.</p>	<ul style="list-style-type: none"> • At rest, there is a small amount of oxygen being taken up by the muscles. • As the muscles undergo exercise, they take up more oxygen, meaning the difference between the oxygen in the capillaries surrounding the muscles and the oxygen in the arteries (the levels of oxygen difference).
	<p>13. How does the A-VO₂ difference of a trained individual differ from that of an untrained individual?</p>	<p>A trained individual is likely to have a larger A-VO₂ difference than an untrained individual.</p>
	 <p>14. What adaptations occur due to cardiovascular training, which influence A-VO₂ difference?</p>	<ul style="list-style-type: none"> • As a result of cardiovascular training, there is an increase in the number of capillaries (increased capillarisation). • Capillarisation allows for an improved rate of gas exchange. • A trained individual has a larger blood supply.

Respiratory System

Questions			
Respiratory System	 Define the terms 'breathing frequency' and 'tidal volume'.	Breathing frequency:	the n
		Tidal volume:	the v
	2. Write an equation to calculate minute ventilation.	Minute ventilation (l/min) = breathing f	
	 3. Fill in the grid on the right, identifying the correct average resting values for each variable (breathing frequency, tidal volume and minute ventilation) for an untrained athlete.	Variable	
		Breathing frequency	
		Tidal volume	
		Minute ventilation	
	 4. Fill in the grid on the right, identifying the correct average values for each variable (breathing frequency, tidal volume and minute ventilation), during submaximal and maximal exercise.	Variable	
		Breathing frequency (per minute)	
		Tidal volume (ml/min)	
		Minute ventilation (l/min)

Questions	
Respiratory System	9. Give a definition for 'diffusion'. 
	Define 'partial pressure'. 
	11. How does gaseous exchange take place in the alveoli? 
	What biological factors aid gaseous exchange between the alveoli and capillaries? 

INSPECTION COPY

COPYRIGHT
PROTECTED

Questions	
Respiratory System	<p>13. Explain how gaseous exchange takes place at the muscles, and what factors aid the exchange.</p> <p>Diffusion of oxygen takes place from the blood to the muscles, and the concentration of oxygen is higher in the blood than in the muscles. Carbon dioxide diffuses from the muscles to the blood. Gaseous exchange occurs through a large capillary network. Gaseous exchange is aided by diffusion, and a large capillary network.</p> <p>Gases are diffused between the blood and the muscles. Gases move from high partial pressure to low partial pressure. Muscles carry a lot of carbon dioxide. Carbon dioxide in the muscles is at a higher partial pressure than in the blood, which has a lower partial pressure.</p>
	<p>14. Found in the medulla oblongata, what is the name of the area of the brain that controls respiration?</p> <p>Respiratory Control Centre (RCC)</p>
	<p>15. What are the names of the two subsections of this area (identified in Q13)? Outline their roles.</p> <p>Inspiratory Control Centre (ICC) Expiratory Control Centre (ECC)</p>
	<p>16. What are the effects of the sympathetic nervous system and the parasympathetic nervous system on respiration?</p> <p>The sympathetic nervous system prepares the body for exercise by increasing the rate of respiration. The parasympathetic nervous system slows down the rate of respiration.</p>

The Neuromuscular System

The Neuromuscular System	Questions	Answers
	1. What is a motor unit?	A motor unit is the combination
	2. Name the three types of muscle fibres and comment on the size of each fibre's motor neurons.	Fibre Type
		Slow oxidative / type I
		Fast oxidative glycolytic (type IIa)
	3. How is the motor neuron connected to a muscle fibre?	Fast glycolytic (type IIb)
		Via the neuromuscular junction
	4. What is meant by 'action potential'?	Action potential is an electrical signal transported by the motor neuron
	5. What happens when an action potential reaches the neuromuscular junction?	Neurotransmitters (made of acetylcholine)
	6. What happens to the muscle cells when depolarisation occurs at the motor end plate?	They contract.
	7. What does the 'all-or-none' law state?	A muscle fibre is either under full tension or at all.

Musculoskeletal System and Analysis of Movement

Musculoskeletal System and Analysis of Movement	Questions			
	 1. Define the two types of joint found in the body and give two examples of where each can be found.	Joint Type		
		1. Ball-and-socket		
		2. Hinge		
	2. Define what is meant by agonistic and antagonistic muscles.	Agonistic muscle	An agonistic muscle is the muscle that causes the movement. The limb to move.	
		Antagonist muscle	An antagonistic muscle is the muscle that opposes the action of the agonistic muscle. It acts as a brake and provides resistance.	
 3. Using a sporting example, explain how agonistic and antagonistic muscles work together in a pair.	(accept any relevant example) For example, during a basketball shot, the agonist muscle is the biceps, which is responsible for the shot (extension of elbow), the antagonist muscle is the triceps, which returns the arm to its original position.			
4. Define the term 'isotonic muscle contraction'.	Isotonic muscle contraction is a type of contraction where the muscle length changes but the tension remains constant. Isotonic muscle contractions are of two types: concentric and eccentric.

		Discrete:	Skills that have
		Serial:	Skills that follow
		Continuous:	Skills that have n produce continu
	<p>5. Below, two ends of a continuum are described. Identify the two ends being described and state which continuum they belong to.</p> <p>(i) Skill takes place in unpredictable surroundings. The skill must be adapted to respond to a stimuli.</p> <p>(ii) Skill takes place in predictable surroundings. There is no need to adapt technique to respond to a stimuli.</p>	<p>Continuum: Environmental</p> <p>(i) Open</p> <p>(ii) Closed</p>	
	<p>6. Define 'low' and 'high' organisation skills and provide a sporting example for both.</p>	Low:	Simple skills that e.g. long jump
		High:	Complicated skills that flow into one another e.g. hurdles

Questions	
Skills, Skill Continua and Transfer of Skills	<p>7. Give a range of examples of how different skills can be categorised by pace.</p> <p>Self-paced: Dart throw, javelin (accept suitable performer).</p> <p>Externally paced: Tennis return, football (accept suitable performer is involved).</p>
	<p>8. Sporting movements can be classified against three continua at one time. Classify 100m freestyle sprint (swimming) against each of the continua and justify your answer for each.</p> <p>Difficulty: Simple – limited</p> <p>Environmental: Closed – takes place in a controlled environment; change to suit environmental stimuli such as opposition.</p> <p>Pacing: External – swimmer's pace is determined by external factors.</p> <p>Muscular involvement: Gross – the sprinter uses large muscle groups instead of accurate movements.</p> <p>Continuity: Continuous – the stroke is continuous.</p> <p>Organisation: Low – the stroke is not highly organised.</p>
	<p>9. What is meant by 'positive transfer of skills'?</p> <p>A positive transfer of skills is the ability to transfer skills to the high degree of similarity between new and old skills or adjustments to their original skills.</p>

Skills, Skill Continua and Transfer of Skills

Questions	
 <p>Give a sporting example of positive transfer.</p>	<p>(Accept any appropriate example)</p> <p>A fly half in rugby can kick a rugby player was asked to perform a foot as they would only need to make a ball) to their previous skill set to p</p>
11. Define 'negative transfer'.	Negative transfer is the negative e performing a new skill. It may oc skill, then struggles to break this h
 <p>12. Give a sporting example of negative transfer.</p>	<p>(Accept any appropriate example)</p> <p>Negative transfer of a skill could o squash forehand, the tennis player attempt to apply topspin to their s squash will not react the same wa</p>
13. Why would a footballer need to use bilateral transfer to become an elite athlete? Give an example of a football skill that would require them to use bilateral transfer.	Bilateral transfer is the transfer of elite level, a footballer would need of skills on both sides of their bod
 <p>14. Using a sporting example, explain what is meant by 'zero transfer of learning'.</p>	<p>Zero transfer means that a previo newly learnt skill, due to both skills For example, performing a somers push pass in hockey.</p>

Practice for Learning

Methods and Types of Practice	Questions	
	 <p>1. Give a sporting example of when whole practice should be used.</p>	Whole practice should be used for skills that doesn't benefit the athlete to break down into parts. For example, a backhand shot in tennis.
	2. What benefit does whole practice have over part practice?	Whole practice enables the athlete to develop a kinaesthetic understanding of the skill. This helps them in the future as they can perform the skill more efficiently.
	 <p>3. Give an example of when 'whole-part-whole' practice would be used. Give a sporting example of a skill that may use this practice method.</p>	Whole-part-whole practice is used for skills that have subroutines. The athlete performs the components, practises these components, and then the whole skill again. For example, a football kick. The athlete practises the run-up, placement of feet, striking the ball. Once these have been practised, the skills are brought together to perform the whole skill.

INSPECTION COPY

COPYRIGHT
PROTECTED

Methods and Types of Practice	Questions	
	 <p>4. Explain the difference between 'whole-part-whole' practice and 'progressive-part' practice.</p>	<p>Whereas whole-part-whole practice breaks the skill down into its components and practises them completely separately to each other, progressive-part practice breaks the skill down into its components and practises them progressively, bringing the subroutines together. For example, in the case of a footballer being kicked from the tee, the player would first practise the run-up and then the striking of the ball. Practice would then be complete the whole skill of kicking the ball.</p>
	 <p>5. Define 'massed practice' and state which types of skills would be completed using massed practice.</p>	<p>Massed practice is the continuous repetition of simple skills that can easily be learned. For example, a swimmer practising a simple stroke.</p>
	<p>6. Define 'distributed practice'.</p>	<p>Distributed practice is similar to massed practice but the practice is spread out over a longer period of time.</p>
	<p>7. What advantages does 'distributed practice' have?</p>	<p>Distributed practice is beneficial for learning complex skills as it allows the learner to perform continuous practice and receive feedback to be given to the learner. This means that more complex skills can be performed more effectively.</p>
	 <p>8. Define 'variable practice'.</p>	<p>Variable practice is the practising of a skill and changing it by a coach.</p>

Methods and Types of Practice	Questions	
	 <p>9. Evaluate the advantages and disadvantages of 'variable practice'.</p>	<p>Advantages:</p> <ul style="list-style-type: none"> • This helps to improve the performance as they learn the optimal response. • It is more realistic for a competition. • Helps to break the monotony of practice. <p>Disadvantages:</p> <ul style="list-style-type: none"> • Cannot be used effectively for simple skills. • Can overwhelm beginners who need a correct stimulus.
	 <p>10. Using a sport of your choice, describe 'mental practice'.</p>	<p>Mental practice is when an athlete visualises a skill without actioning it physically. For example, a footballer visualises taking a penalty kick prior to taking it.</p>
	 <p>11. Evaluate the advantages and disadvantages of 'mental practice'.</p>	<p>Advantages:</p> <ul style="list-style-type: none"> • Can improve confidence as it allows athletes to successfully react to more difficult situations. • Can be used as a stress management tool. • Useful for beginners to create a mental representation of a skill. <p>Disadvantages:</p> <ul style="list-style-type: none"> • Not as effective as physical practice. • Not as effective for simple skills.

Theories of Learning

Theories of Learning	Questions	
	1. Name the three stages of learning.	Cognitive, associative, autonomous
	2. Identify which stage of learning a child who is learning how to rugby tackle for the first time would be in?	The child would be in the cognitive
	3. Describe the stage of learning a child is in (identified in question 2).	<ul style="list-style-type: none"> • The earliest stage of learning without cognitively processing • The tackles would also be incoherent at first, as the child cannot adapt • The child would rely heavily on external feedback (external, positive and terminal) • The child would make errors through trial and error until the skill is learned
	4. Describe the characteristics of a learner in the second stage of learning.	<ul style="list-style-type: none"> • Shift towards physical (as opposed to cognitive) performance of a skill with practice • A learner will make fewer errors in more complex situations or adaptations • Performer uses more intrinsic feedback

PROTECTED

Questions	
Theories of Learning	<p>5 Describe the characteristics of someone in the final stage of learning.</p> <ul style="list-style-type: none"> • High level of skill performance • Physical practice of the skill to • Performer has total knowledge • Learner can only make marginal • The performer is able to adapt
	<p>6 Draw a graph to show the 'learning plateau' and describe what it shows.</p> <div>  </div> <p>7 description: A learning plateau no matter how hard</p>

INSPECTION COPY

COPYRIGHT
PROTECTED

Theories of Learning	Questions	
	7. Suggest reasons why an athlete's learning may plateau.	<ul style="list-style-type: none"> • The performer is not skilled enough • The coaching is not at a high level • The performer is not motivated • The performer is too tired to practice • The performer finds the practice boring
	8. Suggest how a performer could overcome a learning plateau when learning a new skill.	<ul style="list-style-type: none"> • Separate and concentrate on one skill • Develop and use intrinsic rewards • Ask for extrinsic rewards from others • Use a more experienced coach • Allow sufficient recovery periods • Make the practice more enjoyable
	9. Describe the three conditioning techniques, within operant conditioning, that can be used to alter behaviour.	<p>Positive reinforcement – if a performer encourages the athlete to perform better.</p> <p>Negative reinforcement – a negative reinforcement is used to encourage correct behaviour. This reinforces the correct behaviour.</p> <p>Punishment – punishment is used to discourage someone (e.g. a coach). An individual is punished similarly in the future. This weakens the behaviour.</p>

Questions	
Theories of Learning	<p>10. Explain how cognitive theories of learning encourage the learning of new skills.</p> <p>Cognitive theories of learning acknowledge that individuals are constantly taking in information from their environment and responding to it. They believe that individuals learn by forming mental representations of the world around them. Cognitive theories of learning encourage the learning of new skills by focusing on the individual's understanding of the world and their ability to form mental representations of it. Gestaltists believe that skills are learned as whole units (e.g. no subroutines to study). It is the understanding a skill in its entirety that is important. Behaviourist theory breaks a skill into components and an individual can often lead to a skill if they are taught the components of the skill.</p>
	<p>11. Name the four stages of Bandura's theory of observational learning.</p> <p>Attention, retention, motor reproduction, motivation.</p>
	<p>12. Explain what Bandura meant by <i>attention</i> and <i>retention</i> in observational learning.</p> <p>Attention is the observer paying attention to the skill being performed by someone else. Retention is the ability of the observer to store the information in their memory for later use. This enables them to reproduce the skill later.</p>

PROTECTED

Theories of Learning	Questions	
	13. What would be the <i>motor reproduction</i> stage of Bandura's theory of observational learning?	In this stage, the observer attempts to imitate (during the attention stage) based on the model's behaviour.
	14. Name an important consideration when applying the <i>motor reproduction</i> stage of Bandura's theory.	The observer should be of a high level of ability when performing the skill they witness.
	15. Why is <i>motivation</i> an important consideration in Bandura's theory?	The individual must be motivated to imitate the behaviour they reach a required standard.
	16. Observational learning is more likely to take place if there are key factors in place. Outline three factors that can increase the likelihood of behaviours being imitated.	<p>Any three from the following:</p> <ul style="list-style-type: none"> • Reinforcement of behaviours • Demonstrations are clear and concise • The demonstrator is consistent • The learner can associate with the behaviour (is it useful?) • The demonstrator is of a similar age/gender to the learner
	17. Briefly outline how Vygotsky suggested social development theory influences cognitive development.	Social development theory hypothesises that social interactions are the primary influences in cognitive development. Children imitate individuals who are more competent than themselves.
	18. Describe the process of interpsychological learning.	Interpsychological learning is the process where an individual improves their skills on their own through observation and practice.

Questions			
Use of Guidance and Feedback	<div>9</div> <div> Discuss how mechanical guidance would be useful for a beginner learning how to swim.</div>	Useful for a beginner because: <ul style="list-style-type: none">Increases confidence levels.Can increase the safety in certain situations.Provides the learner with a general idea of what to do. Not useful for a beginner because: <ul style="list-style-type: none">Can lead to over-reliance of the learner on the guidance.Learner may not get an exact feel for the skill.	
	<div>10</div> <div>Define 'intrinsic feedback' and list the advantages and disadvantages of this type of feedback.</div> <div></div>	Definition:	Intrinsic feedback is feedback that comes from within the performer, regarding their own performance.
		Advantages:	Can improve a performer's ability to adjust their performance from an external source.
		Disadvantages:	If a performer is not aware of their own performance, they should feel, and they may not be able to adjust their performance.
	<div>11</div> <div>Define 'extrinsic feedback'.</div>	Extrinsic feedback is feedback given to the performer from an external source.	
	<div>12</div> <div>Which stages of learning are most suitable to extrinsic feedback?</div>	Cognitive and associative stages of learning.	
<div>13</div> <div>Describe the advantages and disadvantages of extrinsic feedback.</div> <div></div>	Advantages:	Can be used in early stages of learning to motivate a performer.	
	Disadvantages:	Performer can become dependent on feedback and feedback can be distracting.	

Use of Guidance and Feedback	Questions	
	14. What are the benefits of positive feedback?	Positive feedback is used to compliment a player to perform the same skill to can strengthen the stimulus-response
	15. What are the disadvantages of positive feedback?	A performer may become too dependent on feedback, become unmotivated when they receive negative feedback, become overconfident if too much positive feedback is given.
	16. When would negative feedback be used and what benefits can it have to a performer?	Negative feedback is used when a performer is not performing a skill correctly to motivate a player to perform a skill correctly.
	17. What are the advantages of negative feedback?	In the earlier stages of learning, a performer may need negative feedback due to an unsuccessful performance.
	18. Explain how the use of positive and negative feedback should be adapted to someone in the cognitive stage of learning.	In the cognitive stage of learning, positive feedback should be used a lot to maintain motivation and confidence. Negative feedback should be used a minimum as it can unmotivate a performer (e.g. shouting). Where possible, negative feedback should be used in a constructive way (e.g. demonstrations) so that the performer can learn from their mistakes.

Questions	
Use of Guidance and Feedback	 <p>19. Describe 'knowledge of performance' and 'knowledge of results'.</p>
	<p>Knowledge of performance is an external visual feedback (such as video analysis) that the performer is highly trained in to use.</p> <p>Knowledge of results is an external measure of performance; for example, the time taken to complete a task.</p>
	<p>20. What are the advantages and disadvantages of knowledge of performance?</p>
	<p>Advantages: Can be used to provide immediate feedback.</p> <p>Disadvantages: Too much information can be overwhelming; the cognitive stage of learning is designed for cognitive load.</p>
	<p> 21. What are the advantages and disadvantages of knowledge of results?</p>
	<p>Advantages: Provides a quick and easy way to provide targets for improvement (e.g. time taken to complete a task).</p> <p>Disadvantages: Does not provide information on the quality of performance.</p>

3.1.3 – Sport and Society

Emergence of Globalisation and Sport in the Twenty-first Century

Pre-industrial Britain: pre-1870

Questions		
Pre-industrial Britain: pre-1870	1. Name and describe six characteristics of popular recreation in pre-industrial Britain.	Irregular – the lower classes had many days off – ‘holy days’.
		Unwritten/simple rules – the rules were not written down (or even agreed).
		Lower-class participation – the majority of participants were from the lower classes.
		Violent – sport reflected the violence of the streets.
		Wagering – the upper classes placed bets on the outcome.
		Local – limitations of transport meant that sport was rural.
	2. In pre-industrial Britain there was a two-tier class system. Give an example of sports played by the upper class and lower classes.	Upper class: Real tennis
	Lower class: Mob football	
3. Explain how living conditions affected participation in sport during pre-industrial Britain.	Living conditions for the lower classes were poor, leading to a lack of interest in sport. Therefore, the game was not reflected in their wealth.

Questions	
Pre-industrial Britain: pre-1870	<p>4. Explain how <i>education</i> and literacy of the lower classes shape sport during pre-industrial Britain?</p> <p>Zig Zag Education</p>
	<p>As education and literacy raised, games and sports had to be regulated, therefore, led to further Victorian regulations for people to follow.</p>
	<p>5. Explain how <i>time</i> affected participation in sport during pre-industrial Britain?</p> <p>Zig Zag Education</p> <ul style="list-style-type: none"> • There was a distinct lack of free time. Therefore, sport was played in the evenings. • Long working hours also meant people were tired on days off. • Short amounts of time off work. • The upper classes had more time to participate in sport.
	<p>6. Explain how <i>transport</i> affected the location of sport during pre-industrial Britain?</p> <p>Zig Zag Education</p> <ul style="list-style-type: none"> • Transport was limited in the 18th century, people could not travel far from home. Therefore, of advanced transport means, people could participate in sport. • Bad road systems meant people could not travel far. • Local games led to unwritten rules. • Upper classes were able to travel further in time. Therefore, upper classes could participate in sport.

Questions	
Pre-industrial Britain: pre-1870	 <p>7. Explain why the upper classes played different sports to those played by the lower classes.</p>
	 <p>8. Describe what athletics looked like during pre-industrial Britain.</p>

- Sports reflected the lifestyles of the different classes, with the upper classes playing sports with written, complex rules and the lower classes playing more violent sports.
- The lower classes did not have access to the same equipment, whereas the upper classes had the resources to build the courts, to practise and play on.
- The upper classes had more time to play sports, whereas the lower classes could only participate in sports during their spare time.

- Athletics was referred to as 'pedestrianism'.
- Pedestrianism originated as a form of entertainment, where people would travel the furthest, in the shortest time, for a prize or outcome.
- Gentry betted on the outcome of the races.
- Athletics had few written rules and was often played in a haphazard manner.
- Athletics events were often held in the streets or in open fields.
- Athletics events were generally for the benefit of the participants (e.g. low stakes).

Questions	
Industrial and Post-industrial Britain (1780–1900)	<p>4. Explain the impact that urbanisation had on sport in post-industrial Britain.</p> <ul style="list-style-type: none"> • An increase in work opportunities led to the working class to move to cities for work and recreational activity within towns. • Increase in spectatorship of sport. • Factory owners allowed workers to participate in sport or spectacles. • New facilities were built to facilitate sport. • Increased demand for sport and entertainment. <p>Urbanisation led to less space for open games, such as mob football, village football, and cockle picking.</p>
	<p>5. Explain how a change in transport changed participation in sport, in post-industrial Britain.</p> <ul style="list-style-type: none"> • More affordable and efficient transport. • The working class could travel further. • Increased travelling meant touring sports. • Mass production of cars was not possible until the 1920s. • Rural sports, such as rambling, were popular.
	<p>6. How did increased literacy and mass communication affect sport in post-industrial Britain?</p> <p>A growth in the printing of newspapers and magazines meant that people could follow their favourite sports and events. This led to 'points of view' between the public about sports and events.</p>

Questions	
Industrial and Post-industrial Britain (1780–1900)	<p>7. What influence did the Church have on sport in post-industrial Britain?</p> <ul style="list-style-type: none"> • The Church supported sports as a way of promoting moral values. • Sport was promoted as a way of improving physical fitness. • Sport could be a method of spreading the Christian faith. • The Church set up teams (e.g. football).
	<p>8. After the Industrial Revolution, there was an emergence of professional and amateur status in sport. Define the terms 'professional' and 'amateur' and identify which classes belonged to each category.</p> <p>A professional was an individual whose sport was their main source of income. As such, they were paid for their participation. In contrast, an amateur was someone who played for the enjoyment of it, without financial reward. Amateur athletes as they played sport for leisure.</p>
	<p>9. Explain how women were perceived in sport and the effect their gender had on participation during post-industrial Britain.</p> <p>Women were seen as the weaker sex and were not encouraged to participate in violent games. Middle-class and upper-class women were encouraged to play lawn tennis.</p>

Questions	
Emergence of Globalisation of Sport in the Twenty-first Century	<p>4. Below is the 'golden triangle'. Explain the ongoing relationship between sport, sponsorship and the media.</p> 
	<p>Sport and the media:</p> <ul style="list-style-type: none"> • Sport uses the funding from the media to increase the range of competition • The media recognises sport as a way to reach millions of viewers. Because of this, the media provides sport, such as timings and results.
	<p>Sport and business:</p> <ul style="list-style-type: none"> • Sport uses the funding from businesses to increase the range of competition. This money is used to improve the facilities and to pay the athletes. • Businesses use sport to advertise their products and services. They use the sport as an advertising platform for their products and services.
	<p>Business and the media:</p> <ul style="list-style-type: none"> • Businesses use the media to reach a large population; for example, they use the media to advertise their products and services. They also use the media to reach a large population of viewers who are interested in sport. • Media receives funding from businesses to provide coverage of sport. This funding is used to pay the media staff and to provide the equipment and facilities needed for the coverage.
	<p>5. Describe the effect that free movement of athletes has had on performance in sport.</p> <p>Athletes can now participate in the best competitions from all over the world. This has led to a significant improvement in the performance of athletes and their teams.</p>

Questions			
Emergence of Globalisation of Sport in the Twenty-first Century	<p>6. How has media coverage changed since 1950 to develop sport?</p>	TV	Broadcasting more sport on TV means more sports (notably meaning not only football)
		Radio	Dedicated sports radio allows national/international coverage
		Internet	Provides a platform for streaming of live events
		Social media	Fans have a better understanding of the sport and its news and updates
	<p>7. How has Wimbledon demonstrated a change in attitude towards elite female athletes in the twenty-first century?</p>	<p>Wimbledon offers the same prize money to the male winner. This demonstrates the influence of the women's game spreading into other areas of the sport.</p>

	Questions	
Emergence of Globalisation of Sport in the Twenty-first Century	 <p>8. How has the commercialisation of sport impacted on player development?</p>	<ul style="list-style-type: none"> • Players can now receive sponsorship deals, allowing them to earn money without having to get to the top. • However, to receive important sponsorship deals, a player must be one of the best in the world. • Commercialisation has led to players competing at the highest level, losing their sponsorship deals if they are not successful. • To receive some financial support, players must spend a lot of personal time to produce a product. • Commercialisation of sport has led to players not being able to act responsibly, as they are under pressure to perform.
	 <p>9. Using examples, describe the ways in which commercialisation of sport has impacted on the sports themselves.</p>	<ul style="list-style-type: none"> • Companies have more control over the sport, as broadcasting. For example, a sports channel's TV schedule can determine which teams play and when. • Companies have more control over the sport, as they can buy football pitches, advertising space, and so on. • Competition formats are changing, and, therefore, profitable. For example, scoring on the server's pitch is now a thing.

Emergence of Globalisation of Sport in the Twenty-first Century	Questions	
	Question	Answer
Emergence of Globalisation of Sport in the Twenty-first Century	10. Define 'globalisation'.	The increasing influence of sport internationally.
	11. Give examples of globalisation of sport.	<p>Accept any suitable answers</p> <p>For example:</p> <ul style="list-style-type: none"> • Some Premier League teams have international supporters • Influence of sponsors and advertising (e.g. trophies/competitions) • Advertisements during live broadcasts

The Impact of Sport on Society and Society on Sport: Sociological Theories Applied to Equal Opportunities

The Impact of Sport on Society and Society on Sport	Questions	
	 <p>1. Define 'society' and describe the impact sport has on it.</p>	<p>Society is a community of individuals.</p> <p>Sport helps society as people who participate in sport help society perform well in a sport.</p>
	<p>2. 'Socialisation' is the conformation of a group of people to meet the values and habits of a society.</p> <p>What is the difference between primary socialisation and secondary socialisation?</p> 	<p>Primary socialisation is the socialisation that occurs through the interactions between a young person and their family.</p> <p>Secondary socialisation refers to the socialisation of a person from their teenage years onwards.</p>
	<p>3. Define 'social control' and 'social change' and explain how social processes can influence sports participation.</p> 	<p>Social control – the regulation of behaviour within a society.</p> <p>Social change – changes in social structure and values within a society.</p> <p>Social processes are the processes that influence social change.</p> <p>Social processes can limit sports participation if they do not fill certain roles in society.</p>

The Impact of Sport on Society and Society on Sport	Questions	
		Causes
	<p>4. Social issues can impact sports participation on a global, national or people.</p> <p>Identify the causes and consequences of social issues on sports participation.</p>	<ul style="list-style-type: none"> • Socio-economic status / lack of resources • Lack of role models • Discriminatory attitudes (e.g. racism, sexism, homophobia, stereotyping)
	<p>5. Define 'social stratification' and explain how it can impair sports participation.</p>	<p>Social stratification is the hierarchy of social status.</p> <ul style="list-style-type: none"> • People at the bottom of the hierarchy do not have access to sports facilities • Disadvantaged people do not have the same opportunities • Evident in school and sports participation, therefore, better facilities for the wealthy

	Questions	
The Impact of Sport on Society and Society on Sport	 <p>7. Describe how social class impacts on participation in sports clubs.</p>	<ul style="list-style-type: none"> • Children from low-income families may not have access to sports facilities • Low-income families may not have the time or money to transport children to sports clubs • Working-class families living in council housing may not have access to sports facilities (e.g. commonly middle-class families live in private housing) • Many working-class children do not participate in sports clubs, as are these are common
	 <p>8. Explain the relationship between social action theory with relation to interactionist theory.</p>	<p>Social action theory states that people's actions are influenced by the social interaction (interactionist theory) that they are involved in. For example, people with a high socio-economic status are more likely to be influenced by other influential people. However, people with a low socio-economic status are more likely to be developed as working-class people, who have such a high socio-economic status.</p>
	 <p>9. What are the potential impacts of social action theory on participation?</p>	<p>The creation or advancement of a society within a society. A society can be created by creating positive attitudes to sport. Sport can help to develop new</p>

Questions			
The Impact of Sport on Society and Society on Sport	 <p>10. Define the terms 'equal opportunities', 'discrimination', 'stereotyping' and 'prejudice'.</p>	Equal opportunities	The as s
		Discrimination	The whic grou
		Stereotyping	A ge hov
		Prejudice	A bi
	 <p>11. Identify four barriers to sports participation for disabled people. What solutions are there to overcome the barriers identified?</p>	Barrier	
		Poor facility access (e.g. no ramp equipment (e.g. sports chairs).	
		Limited number of disability-for trainers/coaches	
		Lack of advancement in disabled due to negative attitudes toward disabled sport	
		Lack of media coverage/exposure lack of role models for disabled	

The Impact of Sport on Society and Society on Sport	Questions	
	12. Define the term 'stacking' in terms of ethnic participation in sport and give an example of this.	Stacking is a form of stereotyping in certain sports (or positions), in sport. For example, in American football, quarterbacks (decision-makers) are expected to be fast (speed) / or other suitable roles.
	13. Define the term 'channelling' in terms of ethnic participation in sport and give an example of this.	Channelling is the act of intentionally directing people into certain roles based on their ethnicity. For example, in tennis instead of rugby.
	14. Explain the term 'stereotyping' and that people have a negative attitude towards them (i.e. racism). Give an example of football campaigns that have attempted to tackle discriminatory views.	<ul style="list-style-type: none"> • Kick It Out • Say No to Racism • Show Racism the Red Card
	15. Explain how the named barrier affects minorities in sport and how it is overcome.	Barrier
		<p>Stereotypical views that certain groups are good or bad at certain sports/positions</p> <p>Lack of role models</p>

The Impact of Sport on Society and Society on Sport	Questions	
		Barrier
<p>Zig Zag Education</p> <p>16. Identify the barriers that exist that inhibit sports participation in gender equality. What solutions are there to overcome the barriers identified?</p> <p>Zig Zag Education</p>		Sexist and stereotypical views of women in sport
		Females can be forced down to participate in female-orientated sports, when they may want to participate in other sports
		Lack of media coverage
		Lack of role models
		Less sponsorship
<p>Zig Zag Education</p> <p>17. Describe how schools and local clubs can change in order to cater for disadvantaged, low-income families.</p> <p>Zig Zag Education</p>		Lifestyles of women (e.g. seen as domestic/child-minders)
		<ul style="list-style-type: none"> Community-run projects to provide facilities to the participants) Reduced membership fees

The Impact of Sport on Society and Society on Sport	Questions	
		Health benefits
		<ul style="list-style-type: none"> • Keeps weight at a healthy • Reduced risk of type II diabetes • Decreased risk of cancer • Reduced risk of cardiovascular diseases • Reduced blood pressure • Increased bone health • Reduced risk of depression and mental health issues
		<ul style="list-style-type: none"> • Sporting success can improve • Improved social skills of people • Lower crime rates as people • Enhanced relationships from
	18. Identify six health and fitness benefits that participation in sport can have on people.	
	19. Describe the social benefits that participation in sport can have.	
	20. Identify the roles and aims of Sport England.	<ul style="list-style-type: none"> • To promote participation in • To improve the standard of • Lottery funding provides • Sport England supports

3.1.4 – Exercise Physiology

Diet and Nutrition

Diet and Nutrition	Questions		
	<p>1. Name the seven components of a healthy balanced diet and provide the functions of each.</p>	Dietary Component	
		Carbohydrates	Provide the largest amount of energy by breaking down into glucose for use by the body.
		Proteins	Made of amino acids, protein is essential for tissue and helping muscle repair. It is also a small source of energy.
		Fats	Provide insulation to the body, store energy, increase intensity and are also used for cell membranes. Fats also transport vitamins.
		Minerals	Provide numerous benefits. Calcium (bone growth and repair) and iron (balance and is key in several functions) are key in several accompanying vitamins.

Questions	
Diet and Nutrition	<p>1. (Continued)</p> <p>5. Vitamins</p> <p>6. Fibre</p> <p>7. Water</p>
	<p>Benefits dependent on the type of vitamin. Some vitamins can strengthen the immune system, while others can help to reduce oxidative damage from free radicals. Some vitamins can help to reduce the risk of heart disease by helping to lower cholesterol levels. Some vitamins can help to reduce the risk of cancer by helping to protect cells from damage.</p> <p>Fibre aids the digestive system by helping to move food through the gut. It also helps to regulate the speed at which food is digested, which can help to prevent constipation. Fibre also helps to regulate blood sugar levels, which can help to prevent diabetes. Fibre also helps to regulate blood pressure, which can help to prevent heart disease.</p> <p>Water is key to performance. It helps to regulate body temperature, which can help to prevent overheating. It also helps to regulate blood pressure, which can help to prevent heart disease. Water also helps to regulate the speed at which food is digested, which can help to prevent constipation. Water also helps to regulate the speed at which food is absorbed, which can help to prevent malnutrition.</p>
	<p>2. Identify the three types of fat and explain the difference between them.</p> <ul style="list-style-type: none"> Saturated fats come from sources such as meat, dairy products and desserts. Saturated fats are considered to be 'bad' for health as they can increase blood pressure and heart disease. Trans fats primarily come from man-made sources, such as margarine and shortening. They are also known as 'bad' fats as they can increase blood pressure and heart disease. Unsaturated fats are considered to be 'good' for health as they can help to lower cholesterol levels and reduce the risk of heart disease. They are found in sources such as fish, nuts and vegetable oils.

Dietary Supplements and Manipulation

Dietary Supplements and Manipulation	Questions	
	 <p>1. What kinds of athletes are likely to use creatine as a nutritional supplement? Give reasons for your answer.</p>	<p>Athletes that require high levels of creatine to supplement weight training.</p> <p>Creatine increases the stores of phosphocreatine, the energy source of the body. If a person has more phosphocreatine, therefore, ATP – they have more energy.</p>
	 <p>2. What are the advantages and disadvantages to using creatine as a supplement.</p>	<ul style="list-style-type: none"> • Dehydration • Water retention (weight gain) • Muscle cramping • Some evidence of kidney damage • Muscle cramps
	 <p>3. Why is sodium bicarbonate commonly used by athletes who compete in anaerobic events? Are there any advantages or disadvantages to using bicarbonate?</p>	<p>Sodium bicarbonate acts as a buffer. As such, anaerobic exercises can be performed for longer periods of time as the pH levels of the blood and muscles are maintained. However, sodium bicarbonate can cause stomach upsets.</p>

Preparation and Training Methods

Testing: Important Considerations

Testing: Important Considerations	Questions	
	1. Define 'validity'.	Validity is the degree to which a test
	2. Define 'reliability'.	Reliability is the 'repeatability' of a test to produce the same, or similar, results
	3. An athlete was asked to jump as high as they could as part of a fitness test. They produced a jump once a week for five weeks, at the same time of day, using the same method. Their jump heights were 150 cm, 152 cm, 150 cm, 151 cm, 152 cm. Is this test reliable? Provide reasons for your answer.	The test is reliable. The methods used in the test is also performed at the same time of day, using the same method. The results show that the method used is reliable, meaning the test and the athlete are
	4. The sit-up test was used on an athlete to determine their maximal strength. This is not a valid test. Explain why this is not a valid test.	It is not valid because a sit-up test does not determine the muscular endurance or strength of an athlete.

Questions			
Testing: Important Considerations	 <p>What is quantitative data and what is qualitative data?</p>	Quantitative:	Data that consists of numbers and it is objective.
		Qualitative:	Data that is composed of words, feelings, emotions, thoughts and opinions. It is subjective.
	6. What is objective data and what is subjective data?	Objective:	Measurable data that can be tested.
		Subjective:	Data that consists of words and cannot be measured.
	 <p>7. Give an example of a fitness test that provides quantitative, objective data.</p>	Accept any suitable answers – fitness tests include: <ul style="list-style-type: none"> • Sit-and-reach test • Jump-and-reach test • Bleep test • Handgrip dynamometry • One repetition maximum (1 RM) • Step test • Cooper 12-minute run 	
	 <p>8. Give an example of a qualitative, subjective data that could be collected during fitness testing and explain why it is qualitative and subjective.</p>	Rate of perceived exertion (RPE) / Borg scale Rate of perceived exertion (thoughts and opinions) of the athlete.	

Warm-up and Cool-down and Principles of Training

Questions										
Warm-up and Cool-down and Principles of Training	 1. Describe the physiological benefits of completing a warm-up.	<p>Any from the following:</p> <ul style="list-style-type: none">• Increased temperature which increases the likelihood of injury• Increased speed and strength of muscles• Increased heart rate increases oxygen delivery• Increased breathing rate and depth• Adrenaline is released (fight or flight response)• Increased muscle temperature increases oxygen and energy production rate• Increased speed and efficiency of movement								
	 2. Identify an athlete who would benefit from the stretching types given.	<table><tr><td>PNF</td><td>e.g. A ballet dancer</td></tr><tr><td>Passive</td><td>e.g. An athlete recovering from injury</td></tr><tr><td>Dynamic</td><td>e.g. An athlete warming up</td></tr><tr><td>Ballistic</td><td>e.g. An elite gymnast</td></tr></table>	PNF	e.g. A ballet dancer	Passive	e.g. An athlete recovering from injury	Dynamic	e.g. An athlete warming up	Ballistic	e.g. An elite gymnast
	PNF	e.g. A ballet dancer								
	Passive	e.g. An athlete recovering from injury								
Dynamic	e.g. An athlete warming up									
Ballistic	e.g. An elite gymnast									
 3. Describe the physiological benefits of completing a cool-down.	<ul style="list-style-type: none">• Aids the removal of lactic acid from the muscles• Reduces the likelihood of developing a sore muscle• Helps to prevent blood pooling at the heart• Gently lowers heart rate and blood pressure (normalises body systems)

Questions			
Warm-up and Cool-down and Principles of Training	<p>Zig Zag Education</p> <p>continually improve performance fitness, athletes should make training harder each time. Describe the principles of training that can be used to progress training.</p>	Frequency	The number of times
		Intensity	How hard the perform
		Time	The duration of the s
		Type	The type of training s performance.
	<p>Zig Zag Education</p> <p>7. Describe the three cycles of periodisation and how they are linked?</p>	Macrocycle	A macrocycle is a large Macrocycles are made
		Mesocycle	A mesocycle is typical elements throughout
		Microcycle	Microcycles are typical
	<p>Zig Zag Education</p> <p>8. Apply the three principles of periodisation to a long-distance road cyclist.</p>	<p>The cyclist's macrocycle would be for 1 year. The cyclist's macrocycle would be divided into 4 key elements over the year. Each mesocycle would be 3 months. Each week will focus on one training element spent increasing the cyclist's endurance.</p>	

Warm-up and Cool-down and Principles of Training	Questions	
	 <p>9. Name and describe the three phases of training.</p>	<p>1. Preparatory phase – commonly ‘pre-season’ levels following a rest period to the start of the season.</p> <p>2. Competitive phase – commonly ‘in-season’ must maintain their performance while competing for.</p> <p>3. Transition phase – follows the competitive phase. This phase leads back to the preparatory phase.</p>
	 <p>10. Why are phases of training becoming increasingly important?</p>	<p>As more sports become professional, the need for performance and fitness for longer periods of time. Preseason to gradually get back to peak performance must then maintain performance over the season.</p>
	 <p>11. What is the concept of tapering?</p>	<p>Tapering reduces the volume of training while maintaining the intensity during training.</p>
	 <p>12. If tapering is performed correctly, ‘peaking’ can occur. What is ‘peaking’?</p>	<p>Peaking is a direct result of good tapering. It is the point in time for an event or competition where the athlete is at their best.</p>

Questions	
Biomechanical Principles	<p>9. Define the term 'weight'.</p> <p>Weight is the effect gravity has on the Also accept: Weight (N) = mass (kg) × acceleration Students must clearly differentiate between mass and weight which is measured in Newtons.</p>
	<p>10. An athlete is completing a vertical jump test. Newton's third law states that for every action there is an opposite and equal reaction. What changes in force must the athlete make to complete to move in an upwards direction?</p> <p>The athlete must produce an upwards force (mass × gravity). For example if the athlete weighs 650 N, the athlete must create an upwards force of 650 N.</p>
	<p>11. Write an equation to represent speed and distance. Include units of measurement.</p> <p>Speed (m/s) = distance (m) ÷ time (s)</p>
	<p>12. Define 'the centre of mass'.</p> <p>The centre of mass is the point in or on a body where the mass is concentrated.</p>

Questions	
Biomechanical Principles	 <p>12. Explain the factors that affect the position of the centre of mass.</p> <p>The centre of mass (CoM) is the location where mass is concentrated. As such, CoM can be changed by a body, can change its shape to change its position. A Fosbury Flop will have a CoM outside the body.</p> <p>Mass of an object (and the location of the CoM) affects the performance of a sumowrestler has a greater mass around the CoM than a marathon runner.</p>
	 <p>13. Explain why a skier would bend their knees to become more stable.</p> <ul style="list-style-type: none"> • Centre of mass (CoM) is related to the stability of the body where the centre of mass is in relation to the base of support. If the CoM is inside, the body is stable. • Objects with a lower CoM are more stable. • By bending their knees, the skier lowers their CoM. • Bending the knees helps to widen the base of support. • A combination of a lower CoM and a wider base of support increases stability.

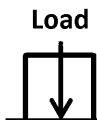

Lever Systems

Questions			
Lever Systems	 <p>1. Define the terms 'load', 'effort', 'fulcrum', 'effort arm' and 'load arm'.</p>	Load:	a weight that needs to
		Effort:	the force required to m
		Fulcrum:	the point around which
		Effort arm:	the distance from the f
		Load arm:	the distance from the f
Lever Systems	 <p>2. Draw simple diagrams of first-, second- and third-class lever systems. Give a sporting example of the lever in work.</p>	First-class Lever System: <div style="text-align: center;">  </div>	
		Sporting example:	extension of the blocks

COPYRIGHT
PROTECTED

Questions	
Lever Systems	<p>Second-class Lever System:</p>  <p>Effort</p>
	<p>Supporting example: a rugby player c</p>
	<p>Third-class Lever System:</p>  <p>Load</p>
	<p>Sporting example: flexion of the e throw</p>

INSPECTION COPY

COPYRIGHT
PROTECTED

Questions	
Lever Systems	<p>3. Give a sporting example of a second-class lever system. Identify the load, effort and fulcrum. Is it advantageous over first- and third-class levers?</p>
	<p>4. Give a sporting example of a third-class lever system. Identify the load, effort and fulcrum.</p>

Second-class levers allow large masses to be moved, producing a large force. This can be achieved by a longer effort arm than the load arm. The load is moved, but this occurs at the expense of speed.

(accept any appropriate example)

Third-class lever system:
 sporting example (elbow flexion) – upwards movement of the forearm
 Load = dumb-bell
 Effort = biceps brachii
 Fulcrum = elbow joint

3.1.6 – Sport Psychology

Psychological Factors that Can Influence an Individual in Physical Activity
Personality

Psychological Factors that Can Influence an Individual in Physical Activity: Personality	Questions	
	1. Define 'personality'.	Personality is the combination of many factors that make up a person's unique characteristics.
	2. Define 'trait'.	A trait is an everlasting feature of a person's personality.
	3. Outline the debate regarding 'nature vs nurture' in personality formation.	Personality is the combination of characteristics that make up a person's unique characteristics. Personality is an innate part of a person's nature (nature). However, some argue that personality is shaped by the environment (nurture).
	4. Outline the social learning theory of personality.	The social learning theory hypothesises that people learn from the environment through observation and experience. People learn to match the social situation they are in and apply the correct behaviour based on the experiences they have had. This is often referred to as 'imitation' or 'modelling'. i.e. Behaviour = Function of environment
	5. Outline the trait theory of personality.	Trait theory states that personality is innate and unchanging. It suggests that certain traits are 'strongest' and have larger effects on behaviour than others. i.e. Behaviour = Function of personality

Psychological Factors that Can Influence an Individual in Physical Activity: Attitudes	Questions	
	 <p>4. Explain how persuasive communication can aid attitude change.</p>	<ul style="list-style-type: none"> • This method uses communication numerous factors. • Firstly, the individual must be willing to change. • They must also be willing to change of someone with a stronger attitude. • If the persuader is of a higher status individual, the message is more likely to be accepted. • The persuader should aim to present the message in a way that is more appealing to the individual through the use of persuasive communication. Finally, the environment where the change occurs should reflect the change in attitude. This is done by creating a supportive environment.
	 <p>5. What is meant by 'cognitive dissonance'?</p>	<p>Cognitive dissonance is the change of attitude towards something. A conflict in attitude can lead to a change in behaviour to reduce the dissonance. Any of the three components of attitude can be changed to reduce the dissonance.</p>

Questions							
<p>5. The Sport Competition Anxiety Test (SCAT) is a self-report questionnaire used to evaluate an athlete's feelings prior to competition and their attitudes towards sport in general.</p> <p>Describe the advantages and disadvantages of SCAT.</p>	<p>Advantages:</p> <ul style="list-style-type: none"> • High reliability – the athlete is likely to give the same response • High validity – SCAT has been shown to be a valid measure of anxiety <p>Disadvantages:</p> <ul style="list-style-type: none"> • Performers may not tell the truth or may give socially acceptable responses • Coaches/trainers can adapt their training to minimise the effects of anxiety. 						
<p>6. Name and describe two more methods of assessing anxiety in athletes. Identify any advantages or disadvantages of each method.</p>	<table> <tr> <th>Method</th><th>Description</th></tr> <tr> <td>Physiological tests</td><td>Measurements of physiological responses such as heart rate and sweating to a number of situations that may cause anxiety</td></tr> <tr> <td>Observational methods</td><td>An external person watches an athlete perform and records any signs of anxiety</td></tr> </table>	Method	Description	Physiological tests	Measurements of physiological responses such as heart rate and sweating to a number of situations that may cause anxiety	Observational methods	An external person watches an athlete perform and records any signs of anxiety
Method	Description						
Physiological tests	Measurements of physiological responses such as heart rate and sweating to a number of situations that may cause anxiety						
Observational methods	An external person watches an athlete perform and records any signs of anxiety						

Aggression

Psychological Factors that Can Influence an Individual in Physical Activity: Aggression	Questions	
	1. Define the term 'aggression' in a sporting context. How is assertive behaviour different from aggression?	Aggression is the intentional behaviour directed towards another person, which can be either channelled aggression or hostile aggression. Assertive behaviour is forceful behaviour that does not involve harming others and is within the rules of the game.
	2. Describe the instinctive theory of aggression and highlight its limitations.	The instinctive theory of aggression proposes that aggression is an innate characteristic that they cannot change. It suggests that aggression is an instinctive aggression characteristic that everyone has. It has been argued that aggression is a release of energy. It has been argued that aggression so the individual is calmer afterwards. However, the theory does not take into account the fact that sport doesn't provide a platform for aggression. Aggressive behaviour can also be learned. It has been argued that aggression has an evolutionary advantage (as it might have helped our ancestors to survive).
	3. What is meant by the term 'catharsis'?	A feeling of relief or calmness, following the release of aggressive impulses.

Psychological Factors that Can Influence an Individual in Physical Activity: Aggression		Questions
<div>4. Describe the social learning theory of aggression and highlight its limitations.</div> <div>5. Using a sporting example, explain the aggressive cue hypothesis.</div> <div>6. Describe the frustration-aggression hypothesis explain aggression as a result of frustration?</div> <div>7. Name and describe five strategies that could be used to control aggression.</div> <div>Accept any suitable combination of the following:</div>	<div>1. </div>	<p>The social learning theory proposes that individuals learn aggressive behaviour from others. An individual witnesses aggressive behaviour in similar situations.</p> <p>The theory, however, does not acknowledge that aggression can be learned from non-aggressive models – suggesting that not all aggression can be learned from others.</p>
	<div>2. </div>	<p>The aggressive cue hypothesis suggests that a stimulus (e.g., a red card) can trigger an individual, leading to increased arousal and aggression. However, this aggression is not released if the individual is not aroused. For example, a footballer may get increasingly frustrated if they are not performing well. When the defender finally makes a mistake, the player releases their aggression towards the defender by pushing or fouling them.</p>
	<div>3. </div>	<p>This hypothesis argues that there is a direct relationship between frustration and aggression. Frustration is the result of increasing frustration, which leads to aggression. The source of the frustration is the trigger for the aggression.</p>
	<div>4. </div>	<p>1. Fines – clubs and players can be fined for aggressive behaviour.</p>
	<div>5. </div>	<p>2. Education – players can be educated on the consequences of aggressive behaviour.</p> <p>3. Lowering arousal levels – arousal control techniques may reduce the likelihood of aggression.</p> <p>4. Removal – removing a player from the game for aggressive behaviour.</p> <p>5. Rewards – rewarding non-aggressive behaviour in the game.</p>

Motivation

Psychological Factors that Can Influence an Individual in Physical Activity: Motivation	Questions	
	1. Define 'intrinsic motivation'.	Intrinsic motivation is motivation that comes from an individual's intrinsic feedback (positive or negative) towards sport.
	2. Define 'extrinsic motivation'.	Extrinsic motivation is motivation that comes from external rewards that can motivate the individual.
	3. What are tangible and intangible rewards? Give examples.	Tangible rewards are rewards which can be physically seen, e.g. sponsorship. Intangible rewards are non-physical rewards, e.g. positive feedback such as praise from a coach.
	4. Explain how extrinsic motivation would be used to motivate a beginner in gymnastics. Give examples of extrinsic motivation.	<ul style="list-style-type: none"> Extrinsic rewards help to motivate someone who is new to a sport. Acts as a motivator to reinforce good experiences (e.g. a treat after the lesson). Competitive young people can use extrinsic rewards as a motivator to continue participation. Some young gymnasts will use extrinsic rewards to keep the motivation to keep going.

Social Facilitation

Psychological Factors that Can Influence an Individual in Physical Activity: Social Facilitation	Questions		
	1. Define 'social facilitation'.	The positive impact performing in front of an audience has on performance.	
	2. Define 'social inhibition'.	The negative impact performing in front of an audience has on performance.	
	3. What effect would an audience have on beginners and experts of a sport or skill?	Beginners:	High arousal leads to decreased concentration to perform the task.
		Experts:	Social facilitation – increased performance of the task or skill and social inhibition – decreased performance of the task or skill.
	4. Zajonc suggested there are four types of factors who can affect an individual's performance. Identify these others.	<ol style="list-style-type: none"> 1. Audience/spectators 2. Other performers (not direct competitors) 3. Other performers (direct competitors) 4. Coaches – social reinforcers 	
	5. When low-level or experienced performers compete in front of an audience, they experience 'evaluation apprehension'. Describe evaluation apprehension and the effect it has on performance.	<p>Evaluation apprehension is the perception of how others are evaluating your performance.</p> <p>Low-level performers will display a negative effect of arousal. They start making mistakes, and their performance decreases.</p> <p>Experienced athletes will display a positive effect of arousal. They perform better under the pressure of an audience, causing them to perform better.</p>

Goal-setting

Psychological Factors that Can Influence an Individual in Physical Activity: Goal-setting	Questions	
	Goal Type	Description
	Outcome goals	Goals that are only completed as a result of a performance (winning or losing)
	Task-orientated Goals	Goals that are only completed at hand. These goals are about the completion (not success) of a task.
	Performance-related Goals	Goals that are concerned with a level of performance or standard, of the performer.
	Process goals	Goals concerned with the execution of a task
1. Describe the named type of goals and provide a sporting example of each.		
2. How do goals affect confidence and self-efficacy of an athlete?	Setting, and therefore achieving, attainable goals helps in completing tasks and increasing confidence. Understanding how to overcome similar obstacles helps in achieving goals.	
3. What effect does goal setting have on task persistence of an athlete?	Setting long-term goals helps to maintain motivation. Having shorter-term goals (that are still challenging) helps to keep attention and motivation to keep pushing forward.

Psychological Factors that Can Influence an Individual in Physical Activity: Goal-setting

Questions	Answers
<p>4. Using sporting examples, describe the SMART principle of goal-setting.</p>	<p>S Specific – goals should have precise aims. This helps to direct the performer.</p> <p>For example, a fly half focusing on the individual components of their game.</p>
	<p>M Measurable – goals that are able to be recorded allow the performer to track their progress.</p> <p>For example, an athlete aiming to improve aerobic fitness by running 5km in 20 mins.</p>
	<p>A Achievable – goals should be challenging, but achievable to build the performer's confidence when they reach their goals.</p> <p>For example, a footballer aiming to win the ball in 60% of possession.</p>
	<p>R Realistic – realistic goals allow the performer to believe they can achieve them.</p> <p>For example, a marathon runner aiming to improve their time by 10%.</p>
	<p>T Time-bound – putting a time limit on achieving a goal creates a sense of urgency and motivation to complete the task.</p> <p>For example, being able to run the 800 m in 3 mins 30 secs.</p>
	<p>E Evaluate – coaches and performers should analyse the success of their goals during this time helps to make future goals more realistic.</p> <p>For example, a swimmer finding extrinsic motivation more effective than intrinsic motivation will be used to achieve the next goal.</p>
	<p>R Review – after evaluation, the performer should think about whether the goal has been completed. When this has been decided, the performer can set a new goal.</p> <p>For example, a rower just misses out on a national qualifying time, they attempt this goal to reach the national qualifying time again.</p>

COPYRIGHT
PROTECTED

Technology for Sports Analytics	Questions	
	4. What is indirect calorimetry?	Indirect calorimetry is a method of studying metabolism by analysing the gases (oxygen and carbon dioxide) that are consumed and produced. The equipment used in indirect calorimetry is a metabolic chamber.
	5. What is GPS used for and what sports can benefit from its use?	GPS (Global Positioning System) can track the movement, acceleration and deceleration of an athlete's body during competition. It is used in many sports including football, rugby and hockey.
	6. Describe how GPS is being used by the general population to aid physical activity.	Modern phones and tracking systems are becoming more accessible to the general population. They are completing daily and allows them to track their activity. Phones and watches can monitor the distance travelled, calculation of acceleration and deceleration, heart rate, health and fitness levels.
	7. What is meant by the term 'data integrity'?	Data integrity is ensuring that data collected is accurate and free from sources of error enter the data. This means ensuring the time between collecting the data and entering it into the system is as short as possible.
