3.1.1: Applied Anatomy and Physiology

3.1.1.1 - The structure and function of the musculoskeletal system

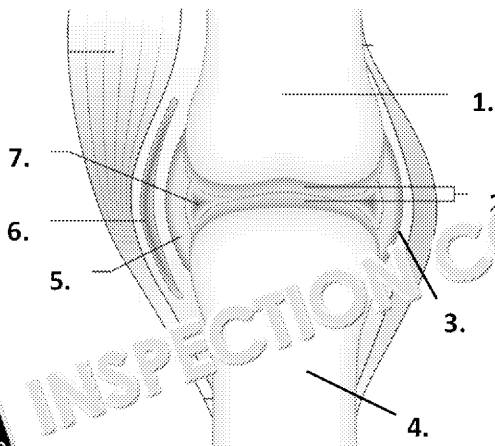

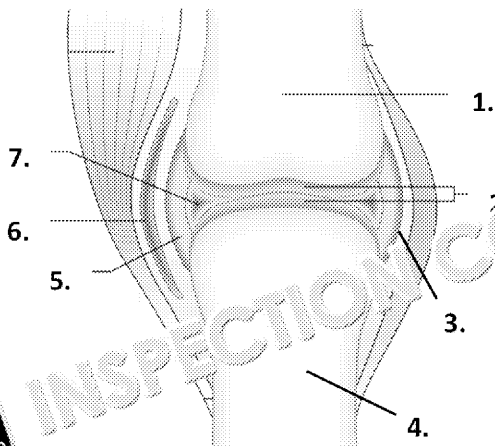

Bones, structure and functions of the skeleton, and synovial joints	Questions			
	1. Name and describe the six functions of the skeleton. For each function, give an example of how it can be applied to sport.		Function	
			1.	Support – The bones provide support for the body, keeping it solid. The bones keeps the body in the
			2.	Protection – Bones provide protection for vital organs (e.g. lungs, heart)
			3.	Movement – The skeleton acts as a point for muscles. The combination of muscles and bones allows the

Shoulder										

Questions		
<p>Bones, structure and functions of the skeleton, and synovial joints. (continued)</p> 	3. Which bone lies in front of the knee joint?	Patella
	4. Label the parts of a synovial joint and explain how some of them prevent injury.	Feature
		1. Bone
		2. Articular cartilage
		3. Synovial membrane
		4. Bone
		5. Joint capsule
		6. Bursa
		Joint cavity containing synovial fluid
	5. Describe the role of ligaments in synovial joints.	Ligaments attach one bone to another
	6. What bones provide protection for internal organs? Give a sporting example of specific bones that provide protection.	<p>Flat bones e.g. the cranium protects the brain, the ribcage protects the sexual organs and digestive organs, and the ribs protect the lungs from being punctured</p>

Questions			
Bones, structure and functions of the skeleton, and synovial joints (continued)	7. What types of bone allow gross movements of the skeleton? Give a sporting example of specific bones that allow gross movement.	Long bones e.g. the femur, tibia and fibula allow extension of the knee used in running elbow joint to making throwing actions	
	8. What types of bone allow fine movements of the skeleton? Give a sporting example of specific bones that allow fine movement.	Short bones e.g. the carpals in the hand allow a swing and spin to the ball	
	9. Describe how the skeleton works with muscles to produce movement	The skeleton provides anchor points for the muscles to pull on to change the shape of the skeleton into the required shape	
	10. Name the types of joint found in the body and name the movements that can be performed at each. Then, define each type of movement.	Type of joint	Movements
		Hinge	Flexion
Extension			
Ball-and-socket		Flexion	
		Extension	
	Rotation		
	Adduction		
	Abduction		

Bones, structure and functions of the skeleton, and synovial joints (continued)	Questions		
	11. What type of joint is found at the shoulder and hip?	Ball-and-socket joint	
	12. What type of joint is found at the knee and elbow?	Hinge joint	
	13. Name and define the movements that can be performed at the ankle.	Type of Joints	
		Plantar flexion	Increasing the angle
		Dorsiflexion	Decreasing the angle

Muscles, movement and antagonistic pairs	Questions				
	1. Label the muscles of the body to the right.				
	2. What role to tendons play in the musculoskeletal system?		Tendons attach muscles to bones, allowing joints.		
	3. Provide a sporting example for each of the types of movement at the following joints.		Joint	Movement	
			Elbow	Flexion	e.g. basketball
				Extension	e.g. ...
			Knee	Flexion	e.g. body
				Extension	e.g. kick

Muscles, movement and antagonistic pairs (continued)

Questions			
<p>4. Provide a sporting example for each of the types of movement at the named joints. (Continued)</p>	Joint	Movement	
	Hip	Flexion	e.g. Bringing the 100 m.
		Extension	e.g. As a long leg away from
	Shoulder	Flexion	e.g. Execution
		Extension	e.g. Preparation cricket.
		Abduction	e.g. Preparation
		Adduction	e.g. Execution
		Rotation	e.g. A tennis
	Example		Mo
			Plantarflexion
<p>5. Identify the movements shown at the ankle and provide the agonist that causes this movement.</p>			Dorsiflexion

Questions					
Muscles, movement and antagonistic pairs (continued)	6. Name and describe the two types of isotonic contraction.				
	Concentric – the muscle shortens during a contraction.				
	Eccentric – the muscle lengthens under tension.				
	7. Describe an isometric contraction.				
	The length of the muscle does not change as it contracts.				
	8. Muscles work in pairs to cause movement at a joint. What are the roles of the agonist and antagonist muscles in movement at a joint?				
	Agonist muscles are the main muscles that cause movement in a particular direction. Antagonist muscles oppose the agonist muscles and relax when the agonist contracts.				
	9. Give an example of an antagonistic pair of muscles used in a part of your body.				
	Accept all suitable answers e.g. The hamstrings and quadriceps used to flex the knee. The biceps and triceps used to extend the elbow to throw a ball.				
	10. Identify the agonistic muscle(s) that cause movement at the shoulder.				
	<table><tr><th>Movement</th></tr><tr><td>Abduction</td></tr><tr><td>Adduction</td></tr><tr><td>Flexion</td></tr><tr><td>Extension</td></tr></table>	Movement	Abduction	Adduction	Flexion

Muscles, Movement and antagonistic pairs (continued)	Questions	
	12. Identify the agonistic muscle(s) that cause movement at the hip.	Movement
		Abduction
		Rotation
		Extension
	13. Identify the agonistic muscle(s) that cause movement at the knee.	Movement
		Flexion
		Extension
	14. For each of the following scenarios, justify whether the muscles are working eccentrically, concentrically or isometrically.	Scenario
		A rugby prop pushing against his opponent in the scrum. The scrum is stable and not moving.
		A gym member slowly lowering themselves from a pull-up
		A swimmer pulling back their arms, under the water during the front crawl

3.1.1: Applied Anatomy and Physiology

3.1.1.2 - The structure and function of the cardiorespiratory system

Questions			
The respiratory system	1. Identify the pathway of air in order from the atmosphere to the blood.	1. Mouth / nose (air is inhaled through the	
		2. Trachea	
		3. Bronchi	
		4. Bronchioles	
		5. Lungs	
		6. Alveoli (oxygen enters the bloodstream via	
	2. Describe the roles of the <i>intercostals</i> , <i>rib cage</i> and <i>diaphragm</i> when a person <i>inhales</i> at rest.	Intercostals	The intercostal muscles contract,
		Ribcage	The actions of the intercostal muscles pull the ribs outwards, increasing the thoracic capacity.
		Diaphragm	The diaphragm contracts, causing an increase in capacity.
	3. Describe the roles of the <i>intercostals</i> , <i>rib cage</i> and <i>diaphragm</i> when a person <i>exhales</i> at rest.	Intercostals	The intercostal muscles relax, causing a decrease in capacity.
		Ribcage	The actions of the intercostal muscles pull the ribs inwards, decreasing the thoracic capacity.
		Diaphragm	The diaphragm relaxes, causing a decrease in capacity.

Questions											
The respiratory system (continued)	<p>4.  We exercise our breathing rate increases and our lungs expand more.</p> <p>Explain how additional skeletal muscles are recruited to allow this to happen.</p>	<p>Three key muscles are used during forced respiration: the pectorals.</p> <p>The sternocleidomastoid contracts, causing the rib cage to move up and out, increasing the volume of the lungs and the atmosphere, and allows more air to enter.</p> <p>The pectorals contract, causing the thoracic cavity to expand.</p> <p>The abdominals aid expiration during exercise by contracting and pushing the lungs at a faster rate.</p>									
	<p>5.  Explain how the pressure difference causes the inhalation and exhalation of air.</p>	<p>Air travels from an area of high concentration to an area of low concentration.</p> <p>During inspiration, the size of the lung cavity increases. Therefore, oxygen moves down the pressure gradient, into the lungs.</p> <p>During expiration, the size of the lung cavity decreases. Therefore, oxygen moves down the pressure gradient, expelling air.</p>									
	<p>6.  Define each of the following lung volumes.</p>	<table><tr><th>Volume</th><th></th></tr><tr><td>Tidal volume</td><td>the volume of air that is inhaled and exhaled during normal breathing</td></tr><tr><td>Inspiratory reserve volume</td><td>the amount of air that can be inhaled after a normal inspiration</td></tr><tr><td>Expiratory reserve volume</td><td>the amount of air that can be exhaled after a normal expiration</td></tr><tr><td>Residual volume</td><td>the amount of air left in the lungs after a normal expiration</td></tr></table>	Volume		Tidal volume	the volume of air that is inhaled and exhaled during normal breathing	Inspiratory reserve volume	the amount of air that can be inhaled after a normal inspiration	Expiratory reserve volume	the amount of air that can be exhaled after a normal expiration	Residual volume
Volume											
Tidal volume	the volume of air that is inhaled and exhaled during normal breathing										
Inspiratory reserve volume	the amount of air that can be inhaled after a normal inspiration										
Expiratory reserve volume	the amount of air that can be exhaled after a normal expiration										
Residual volume	the amount of air left in the lungs after a normal expiration

Questions		Answers						
The respiratory system (continued)	<div></div> <p>7. Identify each of the lung volumes on the spirometer trace.</p>							
	<div></div> <p>8. When exercise begins, explain what happens to the following volumes.</p>	<table><tr><td>Inspiratory reserve volume</td><td>Inspiratory reserve volume decreases because a limited amount of extra air that can be inhaled (inspiratory reserve volume).</td></tr><tr><td>Expiratory reserve volume</td><td>Expiratory reserve volume decreases during exercise; therefore, it becomes smaller.</td></tr><tr><td>Tidal volume</td><td>Tidal volume increases because the body needs more oxygen. Therefore, the body inhales and exhales more air.</td></tr></table>	Inspiratory reserve volume	Inspiratory reserve volume decreases because a limited amount of extra air that can be inhaled (inspiratory reserve volume).	Expiratory reserve volume	Expiratory reserve volume decreases during exercise; therefore, it becomes smaller.	Tidal volume	Tidal volume increases because the body needs more oxygen. Therefore, the body inhales and exhales more air.
	Inspiratory reserve volume	Inspiratory reserve volume decreases because a limited amount of extra air that can be inhaled (inspiratory reserve volume).						
	Expiratory reserve volume	Expiratory reserve volume decreases during exercise; therefore, it becomes smaller.						
Tidal volume	Tidal volume increases because the body needs more oxygen. Therefore, the body inhales and exhales more air.							
9. Give a definition of diffusion.	Diffusion is the movement of gas from an area of high concentration to an area of low concentration.							

Questions	
The respiratory system (continued)	<p>10. Explain how gaseous exchange takes place at the alveoli.</p> <p>The alveoli of the lungs have a high volume of capillary network. At the same time, the red blood cells therefore, diffuses this back into the alveoli.</p>
	<p>11. Which physiological factors aid gaseous exchange?</p> <ul style="list-style-type: none"> • Large numbers of alveoli provide a large surface area • Large capillary network increases surface area • Capillary walls are very thin, slowing the movement of gases • Thin membrane between alveoli and capillaries • Large blood flow increases the opportunity for exchange
	<p>12. What role does haemoglobin play in gaseous exchange?</p> <p>Haemoglobin is the protein found in red blood cells, creating the compound oxyhaemoglobin. Oxyhaemoglobin carries oxygen from the lungs to the muscle cells during exercise and movement.</p> <p>Haemoglobin can also bind to carbon dioxide. It carries carbon dioxide from the muscle cells as a waste product, back to the lungs to be exhaled.</p>

The cardiovascular system	1. What are the roles of veins, arteries and capillaries?	Veins:		Carry deoxygenated blood
		Arteries:		Carry oxygenated blood (to the body)
		Capillaries:		Aid gaseous exchange and transfer of nutrients to transfer to the lungs
		Structure/Characteristic		
	2. Identify the structures and characteristics of veins and arteries, and describe how these characteristics aid the transportation of blood.	Veins	Thin walls	
			Large internal diameter (lumen)	
			Valves	
			Low blood pressure

Questions	
The cardiovascular system (continued)	<p>7. Label the diagram of the heart.</p> 
	1. Aorta
	2. Pulmonary artery
	3. Left atrium
	4. Left ventricle
	5. Right ventricle
	Right atrium
	Deoxygenated blood from the body to the right atrium.
	Deoxygenated blood then flows from the right atrium to the right ventricle.
	The right atrium contracts, forcing blood into the right ventricle. The contraction of the right ventricle causes the atrioventricular valve to close.
8. Describe the cardiac cycle and the pathway of blood through the heart as deoxygenated blood returns from the body.	The ventricles then contract (systole) forcing blood from the right ventricle to the lungs.
	Gaseous exchange occurs at the lungs.
	Oxygenated blood travels through the pulmonary artery to the left atrium.
	The left atrium contracts (systole) forcing blood into the left ventricle. The atrioventricular valves close.
	Oxygenated blood is ejected from the left ventricle through the aorta to the tissues.

Questions						
The cardiovascular system (continued)	9. Describe what is meant by diastole.					
	The ventricles and atria relax and the backflow of blood.					
	10. Describe the process of systole.					
	The ventricles contract, increasing the valves to prevent backflow of blood. the aorta and pulmonary artery.					
	11. Define the terms 'heart rate', 'stroke volume' and 'cardiac' output.					
	<table> <tr> <td>Heart rate</td><td>The number of times</td></tr> <tr> <td>Stroke volume</td><td>The amount of blood</td></tr> <tr> <td>Cardiac output</td><td>The amount of blood</td></tr> </table>	Heart rate	The number of times	Stroke volume	The amount of blood	Cardiac output
Heart rate	The number of times					
Stroke volume	The amount of blood					
Cardiac output	The amount of blood					
	12. Write an equation to calculate cardiac output.					
	Cardiac output (ml/min) = heart rate (b/min) × stroke volume (ml)					
	13. What is an anticipatory rise?					
	An increase in heart rate as the performer prepares for exercise.					
	14. Explain how the body redistributes blood to aid exercise.					
	<ul style="list-style-type: none"> • Blood vessels have the ability to vasoconstrict and vasodilate. • During exercise, there is an increase in blood flow to the muscles. • The body responds by vasodilating blood vessels to the muscles. • The body vasoconstricts blood vessels to non-exercising organs (e.g. the digestive system). • The effect of this is that more blood is directed to the muscles, providing them with more oxygen and energy, to the muscles.

3.1.1: Applied Anatomy and Physiology

3.1.1.3 - Aerobic and anaerobic exercise

Aerobic and anaerobic exercise	Questions	
	1. Define 'aerobic exercise'.	Exercise that requires the presence of oxygen.
	2. Write an equation to show aerobic exercise.	Aerobic exercise = glucose + oxygen → energy
	3. Define 'anaerobic exercise'.	Exercise that is completed without the use of oxygen.
	4. Write an equation to show anaerobic exercise.	Anaerobic exercise = glucose → energy
	5. Give a sporting example of an athlete who competes aerobically. Justify your answer.	e.g. marathon runner, long-distance cyclist The athlete is working for a prolonged period of time at a low work rate. This is achieved by using aerobic energy.
	6. Give a sporting example of an athlete who competes anaerobically. Justify your answer.	e.g. sprinter (running, cycling, swimming) The athlete is working for short periods of time at a high work rate. Energy is produced from anaerobic energy already stored in the muscles.

Questions	
Aerobic and anaerobic exercise (continued)	<p>7. Give an example of a sport that requires the use of both the aerobic and anaerobic systems. Justify your choice.</p> <p>e.g. squash, tennis, boxing, games sports</p> <p>Squash players use both their anaerobic and aerobic systems. Individual rallies last for a short time, with individual rallies lasting for a short time. However, in short rallies or movements, they use their anaerobic system to provide the energy.</p>
	<p>8. Define 'EPOC'.</p> <p>Excess post-oxygen consumption (oxygen debt) after high-intensity (anaerobic) exercise.</p>
	<p>9. Why does EPOC occur?</p> <ul style="list-style-type: none"> During high-intensity exercise, the body produces lactic acid, therefore 'owes' this back to the body. To do so, the body breathes heavily. The increased uptake of oxygen after exercise is due to the anaerobic exercise.
	<p>10. What are the three main parts of a cool-down?</p> <ol style="list-style-type: none"> An activity to maintain elevated heart rate A gradual reduction in intensity of activity A series of static stretches
	<p>11. Give reasons why you should perform a cool-down following exercise.</p> <ul style="list-style-type: none"> Helps to remove lactic acid Reduces chance of DOMS occurring Allows heart rate and breathing rate to return to normal (cardiovascular systems) Redistributes blood that may have been pooled in the limbs

Questions	
Aerobic and anaerobic exercise (continued)	<p>12. Explain how an athlete's diet can be related to aid recovery, and suggest how each component of the diet aids recovery.</p> <p>Hydration:</p> <ul style="list-style-type: none"> • Athletes need to replace the fluids lost during exercise • Fluids with carbohydrates can replenish energy stores • Fluids should also include any nutrients lost during exercise <p>Carbohydrates:</p> <ul style="list-style-type: none"> • Any energy stores used by the body during exercise • Intake of carbohydrates aids recovery by replenishing energy stores and reducing effects of fatigue <p>Proteins:</p> <ul style="list-style-type: none"> • Consumption of protein following exercise aids recovery by repairing muscle tissue • Protein synthesis is the process by which the body repairs muscle tissue after exercise, provided the body with the necessary nutrients
	13. What does DOMS stand for?
	Delayed onset muscle soreness
	14. What causes DOMS?
	Delayed onset muscle soreness (DOMS) is caused by microtears on a cellular level. The body then attempts to repair the muscle, causing soreness.
15. Explain why DOMS Occur?	DOMS typically occurs 24–72 hours after exercise.
	<p>One of the following:</p> <p>Ice bath</p> <ul style="list-style-type: none"> • An ice bath aims to reduce swelling in the muscles, contributing towards DOMS • The cold temperature of the ice bath causes vasoconstriction, reducing blood flow to the damaged muscle, reducing inflammation • Once the body is removed from the ice bath, blood flow returns to normal, providing the necessary nutrients for repair from the muscles. <p>Massage</p> <ul style="list-style-type: none"> • Tiny tears in the muscles following exercise cause soreness. • Massage helps to break down the muscle tissue, reducing inflammation • Massage also promotes blood flow to the muscle tissue.
16. Using a specific example, explain one recovery method that helps to prevent DOMS following high-intensity exercise.

3.1.1: Applied Anatomy and Physiology

3.1.1.4 - The short-term and long-term effects of exercise

Questions			
Short-term and long-term effects of exercise	1. Describe the immediate effects of exercise on the cardiovascular and respiratory systems.	Cardiovascular response	
		<ul style="list-style-type: none"> Heart rate increases to meet the demand of the working muscles The heart contracts more powerfully (pumps more blood out with each contraction - stroke volume) Cardiac output increases due to increased heart rate and stroke volume Greater cardiac output means more oxygen-carrying blood can reach the muscles Vasodilation of capillaries at surface occurs to aid thermoregulation 	
	2. Explain why the following short-term effects happen as a result of exercise.	Increased body temperature	During exercise, heat is produced by the muscles creating an increase in overall body temperature.
		Increased sweating	In response to an increase in body temperature, sweating occurs to aid evaporation.

Questions	
Short-term and long-term effects of exercise (continued)	<p>3.  Jack has just completed a high-intensity circuit training session.</p> <p>Describe the short-term effects Jack may experience in the 36 hours after the exercise.</p>
	<ul style="list-style-type: none"> • Fatigue – caused by working the muscles and become 'heavy' or lethargic • DOMS – intense exercise can cause muscle pain • Nausea – caused by a lack of nutrients • Light-headedness – caused by a loss of blood pressure • Cramping – an intense pain in the muscles. This is caused by general fatigue or dehydration
	<p>4.  How does long-term exercise help to improve body shape?</p>
	<p>Body shape changes over time to meet the needs of the body. People who exercise regularly will experience a loss of body fat and become 'toned'. Aerobic exercise tends to cause a loss of weight. Resistance training (lifting weights) will cause an increase in muscle mass.</p>

Questions	
Short-term and long-term effects of exercise (continued)	<p>5. Explain the long-term effects of exercise on the fitness of an individual.</p> <ul style="list-style-type: none"> • Increased stamina / cardiorespiratory capacity – the exercise being undertaken. This allows oxygen to be transported through the body, and the cardiovascular system to pump blood around the body, as a result of the exercise. • Increased speed – this is due to increased muscle power and more powerful muscle contractions over a shorter period of time. • Increased flexibility – when an athlete is more pliable. This means their joints can move through a greater range of motion. • Increased strength – prolonged exercise leads to an increase in the size, number and strength of muscle fibres, which can then produce more powerful muscle contractions. • Increased muscular endurance – an increase in the efficiency of slow-twitch muscle fibres, allowing muscular contraction to be sustained for longer periods of time.
	<p>6. What is the term used to explain a resting heart rate of less than 60 bpm?</p> <p>Bradycardia</p>

Questions		
Lever systems (continued)	<p>6. Draw a first-class lever system and label the resistance arm and effort arm.</p> 	
	<p>7. Draw a third-class lever system.</p> 	

	Questions	
Lever systems (continued)	<p>8. To the right are two images of sporting movement. Identify the lever system being used in each image, and label the components of the lever on the image.</p>	 
	<p>9. Write the equation to represent mechanical advantage.</p>	<p>Mechanical advantage = effort arm ÷ resistance arm</p>
	<p>10. Why does a first-class lever system have a mechanical advantage? What effect does this have on movement?</p>	<ul style="list-style-type: none"> • Movements can be balanced because the effort and load are equidistant from the fulcrum. • This means a wider range of movements can be achieved.
	<p>11. Why does a second-class lever system have a mechanical advantage? What effect does this have on movement?</p>	<ul style="list-style-type: none"> • Large loads can be moved with little effort. • The large loads can be displaced, but only a small distance.

	Questions	
Lever systems (continued)	12. Why are third-class lever systems considered to be a mechanical disadvantage?	In third class lever systems, the resistance arm is longer than the effort arm. However, speed and range of movement are increased. Some movements can be completed quickly.
	13. Give sporting examples of a first-, second- and third-class lever system. (Use different examples from those given in Question 8.)	First-class: e.g. rugby line-out/throw
		Second-class: e.g. dorsiflexion of the ankle
		Third-class: e.g. flexion of the knee (biceps)

Planes and axes of movement		Questions	
	1.  Name the 'sagittal', 'frontal' and 'transverse' planes of movement.	Sagittal:	Divides the body into left and right halves.
		Frontal:	Divides the body into front and back halves.
		Transverse:	Divides the body into upper and lower halves.
	2.  Label the three planes of movement on the diagram.		
	3. Name and define the three axes of rotation a body can move in.	Longitudinal	Travels through the body along the axis.
		Transverse	Travels through the body across the axis.
		Sagittal	Travels through the body along the axis.

Planes and axes of movement (continued)	Questions	
	<p> 4. Label the axes of rotation on the diagram.</p>	
<p> 5. For the following sporting movements, state which plane and axis each movement is occurring in.</p>	<p>A diver performing a somersault</p> 	<p>A long jumper performing the take-off</p>

Questions		Answers		
5. Fill in the table, naming the component of fitness by providing a definition of the component of fitness.		Agility	Being able to change direction at	
		Speed	The rate at which a movement is	
		Balance	The ability to keep the centre of	
		Coordination	The ability to use more than	
		Cardiovascular endurance	The ability of the cardiovascular system to sustain a continuous period of time	
6. For each of the components of fitness, give an example of a sport that requires that fitness component and justify your answer.		Fitness component	Sporting example	
		Muscular endurance	e.g. marathon runner	Marathon runner runs a very long period
		Flexibility	e.g. synchronised swimmer	A synchronised swimmer moves their body quickly
		Reaction time	e.g. 100 m sprinter	100 m sprinter starts quickly as possible
		Static strength	e.g. prop in a scrum	A prop must be stationary and strong
		Dynamism	e.g. basketball player	Basketball player must perform at a high level

3.1.3: Physical Training

3.1.3.3 Principles of training and their application to training

Principles of training and types of training	Questions		
	1. Name and describe the principles of SPORT to maximise improvements in sporting performance from training.	S	Specific – training should be specific to the sport.
		P	Progressive overload – training should be progressive to ensure performance levels plateauing, continuing to improve.
		R	Reversibility – regular training ensures that improvements in performance are maintained.
		T	Tedium – training should be varied to avoid boredom.
	2. Give a sporting example of how each principle of SPORT could be implemented.	S	e.g. a marathon runner would not be training for a sprint.
		P	e.g. a weightlifter would make sure to increase the weight lifted over time.
		R	e.g. a basketball player would train to improve their endurance with long distance running.
	3. Explain how overload can occur using the FITT principle.	T	e.g. a rugby player would do numerous short bursts of high intensity training.
		F	Frequency – the number of times an individual trains each week.
		I	Intensity – how hard the performer is working each session.
		T	Time – the duration of the training session.
		T	Type – refers to the type of exercise the performer participates in.

Principles of training and types of training (continued)	Questions	
	Training type	Description
	1. Continuous	Exercising without constant intervals
	2. Fartlek	A combination of interval training and continuous exercise
	3. Interval	Exercising at high intensities with periods of rest, or low intensities
	4. Plyometric	High-intensity jumping activities. The pre-stretching (eccentric contraction) is followed by a powerful concentric contraction
	5. Circuit	Numerous workstations with exercises tailored to suit the individual
	6. Static stretching	Stretching that holds the muscle constant for a period of time (isometric contraction)
	7. Weight training	Using free weights, machines, or resistance bands to strengthen muscles and improve endurance. Sets and reps.

Principles of training and types of training (continued)		Questions	
	5.	What considerations should a coach make when completing a circuit training session?	The intensity that the athlete works at should be appropriate for the length of the training. Also, continuous training for a sprinter would not need to be continuous.
		6. When designing a circuit session, the coach should ensure there is enough space to hold all of the circuit stations. What else should the coach check in order to design a successful circuit training session?	They should check that they have all the equipment and also consider whether the number of circuits involved is appropriate.
	7.	Using specific examples, apply the principles of SPORT and FITT to a circuit training session.	Application to a circuit training session
			S The circuit session should be specific to the aim of the individual taking part in the circuit.
			PO Each circuit session should increase in difficulty to encourage the athlete's body to adapt and meet the demands of the exercise.
			F The circuit session should be held regularly to prevent the positive adaptations from the session being lost.
			T The circuit session should involve fitness and skills that the athlete actually uses in their sport.

Questions	Answers
7. Using specific examples, apply the principles of SPORT and FITT to a circuit training session.	Application to a circuit training session
	The circuit sessions should be regular enough for positive adaptations to take place.
	I The intensity of a circuit session should be high enough that the athlete is being pushed.
	T The circuit session should be long enough to include all of the stations and for each station to have an impact on the athlete.
8. Give tips to a coach who is planning a fartlek training session. (Continued)	<ul style="list-style-type: none"> Intensity should vary Exercises should be sport-specific (e.g. games players) Ensure both aerobic and anaerobic systems are worked
9. How should interval training be adapted for a beginner athlete?	The intensity of exercise should suit the fitness levels of the athlete to recover and continue exercise.
10. What does HIIT stand for?	High-intensity interval training
11. How should an athlete perform static stretching in order to avoid injury?	<p>The athlete should not 'bounce' when stretching the muscle.</p> <ul style="list-style-type: none"> Correct technique should be used when stretching, i.e.

3.1.3: Physical Training

3.1.3.4 How to optimise training and prevent injury

Optimising training and preventing injury	Questions	
	1. Is there a training threshold?	A training threshold is the intensity of exercise
	2. Training thresholds can be set at percentages of maximum heart rate. How is maximum heart rate calculated?	Maximum heart rate = $220 - \text{age}$
	3. What percentage of maximum heart rate does aerobic training occur in?	60–80%
	4. What percentage of maximum heart rate does anaerobic training occur in?	80–90%
	5. Dan is 27 years old. He wants to train aerobically. Calculate the heart rate range that Dan should work within to train anaerobically.	$220 - 27 = 193$ $80\% \text{ of } 193 = 154$ $90\% \text{ of } 193 = 174$ Heart rate range = $154 - 174 \text{ bpm}$
	6. Calculate the heart rate range that a 22-year-old female should work within to improve her aerobic fitness.	$220 - 22 = 198$ $60\% \text{ of } 198 = 119$ $80\% \text{ of } 198 = 158$ Heart rate range = $119 - 158 \text{ bpm}$

Questions	
7. Circuit training can be altered to suit the needs of the athlete. What should be altered in a circuit to suit the fitness aim of a circuit?	<ul style="list-style-type: none"> The time of each exercise/station The activity completed at each station The amount of rest between stations and circuits
8. The intensity/weight used in weight training is determined using one-repetition maximum (1RM). What is 1RM?	One-repetition maximum is the maximum amount of weight that can be lifted once.
9. What are 'reps' and 'sets'?	Reps: (Repetitions) are the number of times an exercise is performed.
	Sets: A set is a collection of a specified number of repetitions.
10. Explain how 1RM can be used to allow an athlete to improve their strength and power.	Strength and power can be improved by lifting weights that are 80-90% of 1RM. These weights should be lifted in a set containing low repetitions (e.g. 1-5).
11. Explain how 1RM can be used to allow an athlete to improve their muscular endurance.	To improve muscular endurance, an athlete would perform more sets with low weights and high repetitions (e.g. 10-15).

Altitude training and seasonal aspects	Questions	
	1. What is altitude training?	Altitude training is training in environments high above sea level.
	2. Explain the physiological changes that occur to an athlete training at altitude and how these changes affect their performance.	<p>At high altitudes, the amount of oxygen in the air is low. As there is less oxygen in the air to bind to red blood cells, the athlete will struggle to consume enough oxygen to compensate for the low oxygen levels in the air. Producing more red blood cells means more oxygen can be taken from the air and delivered to the muscles.</p> <p>When the athlete returns to sea level, they will find the percentage of oxygen in the air at sea level. Having more red blood cells means the athlete can utilise greater amounts of oxygen to exercise aerobically for longer without fatigue.</p>
	3. Give two examples of athletes who would benefit from altitude training.	Accept any suitable answers that mention an athlete who would benefit from altitude training, e.g. marathon runner / long-distance cyclist / triathlete.

3.1.3: Physical Training

3.1.3.5 Effective use of a warm-up and a cool-down

Questions		Answers	
1. Name four components that should be part of a warm-up.	1	An activity that slowly increases the pulse rate	
	2	Stretching activities	
	3	Mental preparation for the exercise	
	4	Performing skills that replicate movements	
Warm-ups and cool-downs	2. Describe the physiological and psychological benefits of warming up before an activity.	<ul style="list-style-type: none">• Practising sport-specific skills increases focus• Body temperature gradually rises, which prepares the muscles• The athlete will be physiologically and psychologically ready• More oxygen will be circulating the body due to increased heart rate• Stretching increases the range of movement• Reduced chance of injury• Gradually warming up reduces the shock of exercise	
	3. Plan a warm-up for a footballer prior to a match.	<p>Accept any suitable answer.</p> <p>E.g. First the footballer should complete light jogging for 5 minutes.</p> <p>They could then complete some static or dynamic stretching.</p> <p>The footballer should then complete sport-specific drills.</p> <p>A few minutes before a match, the player could take a short rest for mental preparation.</p>

Questions	
Understanding data (continued)	<p>8. To the right is a graph plotting speed of a 100 m sprinter in a race.</p> <p>a) Explain what is happening between 1 second and 8 seconds.</p> <p>b) Calculate the distance travelled between 8 and 11 seconds.</p>
	<p>Explanation:</p> <ul style="list-style-type: none"> Between 1 second and 8 seconds, the sprinter is at a constant speed of 3 m/s. This means that between 1 second and 8 seconds, the sprinter has travelled 24 m.
	<p>Calculation:</p> <ul style="list-style-type: none"> Distance = speed × time Distance = 12 m/s × 3 s Distance = 36 m

Questions

9. Draw a bar chart of the distance thrown by a shot put using the following data:

Attempt	Distance (m)
1	55
2	65
3	65
4	65
5	60
6	70

10. Below is a graph showing the average number of spectators in a football stadium over the last 10 years. Answer the questions to the right using the graph.

- a. In what year did the number of spectators hit its lowest?
b. Between what years did the average number of spectators remain the same?

Describe the trend of spectators between the years 2013 and 2016.
