Terms and Conditions of Use

Terms and Conditions

Please note that the **Terms and Conditions** of this resource include point 5.3, which states:

“You acknowledge that you rely on your own skill and judgement in determining the suitability of the Goods for any particular purpose.”

“We do not warrant: that any of the Goods are suitable for any particular purpose (e.g. any particular qualification), or the results that may be obtained from the use of any publication, or expected exam grades, or that we are affiliated with any educational institution, or that any publication is authorised by, associated with, sponsored by or endorsed by any educational institution.”

Copyright Information

Every effort is made to ensure that the information provided in this publication is accurate and up to date but no legal responsibility is accepted for any errors, omissions or misleading statements. It is ZigZag Education’s policy to obtain permission for any copyright material in their publications. The publishers will be glad to make suitable arrangements with any copyright holders whom it has not been possible to contact.

Students and teachers may not use any material or content contained herein and incorporate it into a body of work without referencing/acknowledging the source of the material (“Plagiarism”).

Disclaimers

This publication is designed to supplement teaching only. Practice questions may be designed to follow the content of a specification and may also attempt to prepare students for the type of questions they will meet in the examination, but will not attempt to predict future examination questions. ZigZag Education do not make any warranty as to the results that may be obtained from the use of this publication, or as to the accuracy, reliability or content of the publication.

Where the teacher uses any of the material from this resource to support examinations or similar then the teacher must ensure that they are happy with the level of information and support provided pertaining to their personal point of view and to the constraints of the specification and to others involved in the delivery of the course. It is considered essential that the teacher adapt, extend and/or censor any parts of the contained material to suit their needs, the needs of the specification and the needs of the individual or group concerned. As such, the teacher must determine which parts of the material, if any, to provide to the students and which parts to use as background information for themselves. Likewise, the teacher must determine what additional material is required to cover all points on the specification and to cover each specification point to the correct depth.

ZigZag Education is not affiliated with Pearson, Edexcel, OCR, AQA, WJEC, Eduqas, SQA, CCEA, CIE, International Baccalaureate Organization or DFE in any way nor is this publication authorised by, associated with, sponsored by or endorsed by these institutions unless explicitly stated on the front cover of this publication.

Teacher's Introduction

This resource is for use with A Level AQA Psychology and covers 4.2.1 Approaches in Psychology, 4.2.2 Biopsychology and 4.2.3 Research Methods which are examined in Paper 2: Psychology in Context.

Remember!

Always check the exam board website for new information, including changes to the specification and sample assessment material.

Each topic test starts with quick, short-answer questions that ensure the core, fundamental ideas of each topic are understood by the student. Questions then increase in difficulty and culminate with either exam-style questions or detailed activities which are engaging, help consolidate learning and give students the opportunity to practise applying their knowledge of research methods to various scenarios.

A range of question styles has been used to expose students to different question types and to give variety in the activities, as well as providing some questions in an exam-style format. There are questions embedded in the tests which assess students' research methods knowledge, which would be expected in their exams. Mark allocations and answers are provided, which are useful for peer- and self-assessment as well as providing you, the teacher, with an opportunity to assess students' strengths and weaknesses in order to inform the teaching and learning process.

A levelled marking scheme has been included for slightly longer answers. Teachers should use this firstly to determine an overall level and then to decide whether the answer meets the lower level, moving up to the next. They should then determine a specific mark within that level by judging the answer against the specific criteria.

Note that the research scenarios used and data provided are fictional.

A calculator will be required for use with Topic Test 18.

Specification reference table

This table can be used to identify which specification points you are teaching and select the appropriate topic test to suit your needs. Note that the resource generally follows the specification order, with related content covered in the same test. Tests 4, 5, 9, 10, 11, 12 and Test 17 are for A Level only and include content not required by AS students. Additionally, tests 2, 3, 19 and 20 include some questions that are 'A Level only', these have been identified within the tests themselves. If you are teaching AS students, we suggest giving out tests 19 and 20 together and getting students to complete only the questions that are applicable to them.

Each test is, on average, worth 28–45 marks in total and should take approximately 30–45 minutes to complete. However, some tests are slightly longer due to the quantity of content covered.

Topic test	Topic test title	AS spec point	A Level spec point	Total marks	
1	Learning approaches	3.2.1	4.2.1	41	
2	Cognitive approach			31 (AS) 47 (A Level)	
3	Biological approach			15 (AS) 27 (A Level)	
4	Psychodynamic approach (A Level only)			N/A	36
5	Humanistic approach (A Level only)			N/A	46
6	Divisions of the nervous system	3.2.1.1	4.2.2	36	
7	Neurons and synaptic transmission	3.2.1.1	4.2.2	30	
8	The endocrine system and the fight or flight response	3.2.1.1	4.2.2	33	
9	Methods of investigating the brain	N/A	4.2.2	28	
10	Localisation of function in the brain	N/A	4.2.2	30	
11	Plasticity and functional recovery	N/A	4.2.2	31	
12	Split-brain research and lateralisation of the brain	N/A	4.2.2	35	

Continued overleaf

Topic test	Topic test title	AS spec point	A Level spec point	Total marks
13	Aims, hypotheses, sampling and piloting	3.2.3.1	4.2.3.1	42
14	Experimental design, observational design, case studies and questionnaire construction ¹	4.2.3.1	4.2.3.1	46
15	Variables, control, demand characteristics and investigator effects	3.2.3.1	4.2.3.1	43
16	Ethics, peer review and implications for the economy	3.2.3.1	4.2.3.1	32
17	Reliability, validity, features of science and reporting (A Level only)	N/A	4.2.3.1	36
18	Types of data and descriptive statistics ²	3.2.3.2	4.2.3.2	38
19	Presentation of data, distributions, correlations, levels of measurement and qualitative analysis ³ (mostly A Level only)	3.2.3.2	4.2.3.2	12 (AS) 31 (A Level)
20	Inferential testing (mostly A Level only)	3.2.3.2	4.2.3.2	8 (AS) 32 (A Level)

¹ This test includes questions on experimental methods, observational techniques, self-report techniques and case studies.

² A calculator is required for test 18

³ This test includes questions on correlations and coding in content analysis.

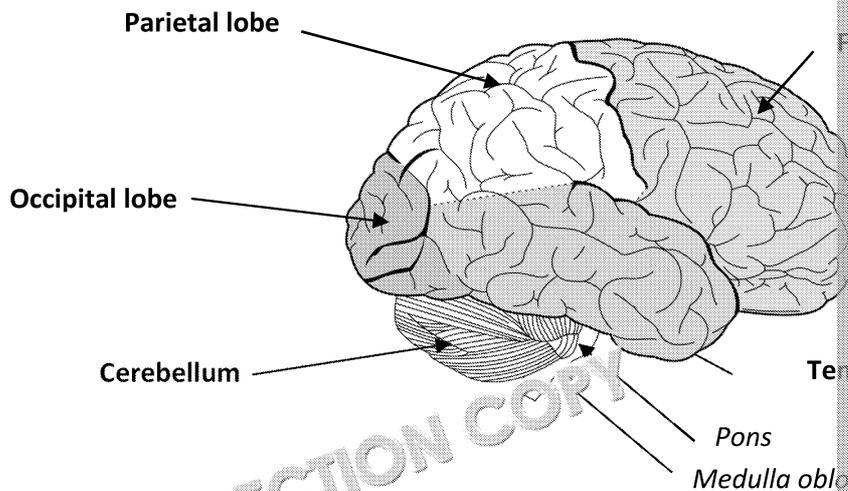

November 2025

Update v1.1, November 2025 (to match specification changes for first teaching September 2025)

- Combined the three packs titled Topic 5: Approaches in Psychology, Topic 6: Biopsychology and Topic 7: Research Methods into a single pack titled Paper 2: Psychology in Context
- Removed test titled 'Origins of Psychology', plus answers.
- Removed reference to 'modelling' in Q9 of test titled 'Learning approaches', plus answers.
- Removed 'the emergence of' from 'cognitive neuroscience' in Q6 of test titled Cognitive approach, plus answers.
- Replaced 'genes' with 'cognitive neuroscience' in Q1 of test titled;Biological approach', as no longer in the biological approach.
- Removed test titled 'Biological rhythms', plus answers
- Moved test titled 'Methods of investigating the brain' to follow test titled 'The endocrine system and the fight or flight response'
- Removed Q1d and its answers from test titled 'Variables, control, demand characteristics and investigator effects', as the specification no longer includes 'confounding variables'
- Removed Q6 iii) and answers from test titled 'Presentation of data...', as the specification no longer includes 'Thematic analysis'
- Reworded 'sampling techniques' to 'sampling methods' in Q7 of test titled 'Aims, hypotheses, sampling and piloting'
- Reworded 'content analysis' to 'coding in content analysis' in Q6 i) of test titled 'Presentation of data...'
- Added Q5c to cover 'control groups' in test titled 'Variables, control, demand characteristics and investigator effects'

10. Localisation of function in the brain

1. a. The theory which states that all parts of the brain are involved in the production of behaviour is known as:
 - a) Lateralisation theory
 - b) Holistic theory
 - c) Localisation theory
 - d) Wernicke's theory
- b. The theory which states that different areas of the brain are responsible for different functions is known as:
 - a) Lateralisation theory
 - b) Holistic theory
 - c) Localisation theory
 - d) Wernicke's theory
2. a. Below is a diagram of the brain. Identify the location of the somatosensory and auditory areas in the brain.

- b. Identify the two language centres of the brain, state where each language centre is located and outline the function of each area.
3. *Phineas Gage suffered a brain injury which destroyed part of his left frontal lobe, resulting in significant personality impairments; however, his personality changed drastically. He went from being a polite and well-liked individual to being a rude and hostile individual.*
 - a. How does the case study of Phineas Gage support the theory of localisation of function in the brain?
 - b. 'Phineas Gage's case study was influential in the psychological field.' Evaluate the use of case studies in psychological research.
 - c. Brain scans are often used to show how different areas of the brain are involved in different tasks. Explain why this is seen as an advantage.
4. *Emma is watching TV when her mobile phone rings. Instead of picking up the phone, she reaches for the remote control to turn down the volume on the TV. Emma mistakenly touches the side of her coffee mug. The coffee spills and Emma quickly moves her hand.*

There are different areas of Emma's brain which are activated.

Outline the function of each of these areas and explain its role in the above scenario.

Preview of Questions Ends Here

This is a limited inspection copy. Sample of questions ends here to avoid students previewing questions before they are set. See contents page for details of the rest of the resource.

20. Inferential testing

1a. **1 mark for accurately identifying each element:**

- *Experimental design:* Repeated measures
- *Level of measurement:* Nominal data

1b. **1 mark for each correctly identified element of carry over sign test:**

- Indicate the direction of change for each participant (i.e. +, - or 0).
- Add up the total of each direction to calculate the observed value (i.e. the total direction).
- Calculate N by adding up the number of participants, subtracting any with 0 difference.
- Look up the critical value with a critical value table, using N, the hypothesis type and the level of significance.
- The difference is significant if the observed value is lower than the critical value.

2b. Non-parametric tests can be used with data that is not normally distributed.

The following answers are for A Level only!

A Level only

3a. **1 mark for each appropriate definition; for example:**

- *Type I error:* Accepting the alternative hypothesis when it is false (i.e. a false positive)
 - *Type II error:* Accepting the null hypothesis when it is false (i.e. a false negative)
- Accept suitable alternatives.*

3b. **1 mark for accurately identifying each error (sub-max. 2 marks), 1 mark for an appropriate alternative (sub-max. 2 marks):**

Scenario	Type I or Type II error?
A researcher thinks they have found a significant difference between men and women in levels of numerical reasoning, but there is no difference in reality.	Type I error (1)
A researcher thinks there is no difference in depressive symptoms between two groups taking different antidepressant medications, but there is a difference in reality.	Type II error (1)

4. **2 marks for an appropriate explanation; for example:**

- P values measure the probability of finding the effect in the sample data if there is no effect. If the p value is less than 0.01, this means that the effect in the data would be found in less than 1% of the data if there was no effect.

Accept suitable alternatives.

5. **1 mark for each correct match:**

Interval level data, using an independent groups design.	_____
Interval level data, seeking to assess the relationship between two variables.	_____
Nominal level data, using an independent group design.	_____
Interval level data, using a repeated measures or matched pairs design.	_____

INSPECTION COPY

**COPYRIGHT
PROTECTED**

A Level only

6. **1 mark for each accurately selected test (sub-max. 2 marks), 2 marks for each clear justification (sub-max. 4 marks); for example:**

Scenario	Test and justification
A researcher has carried out a study about the effects of meditation and walking on feelings of social anxiety. He used a repeated measures design, and upon initial inspection of his data he has found that it is not normally distributed.	<p>Wilcoxon test (1)</p> <p>The Wilcoxon test is used for repeated measures non-parametric test, it is suitable for non-normally distributed data (1).</p>
A psychologist has conducted some research on the association between self-esteem and political attitudes. She used Likert scale questionnaires, and her data is normally distributed.	<p>Either test can be accepted if suitably justified. This is because there is debate as to whether Likert scales are ordinal or interval. It is acceptable to treat Likert scales as interval (technically, it is ordinal) and, therefore, to use a parametric test.</p> <p>Example justifications:</p> <p>Pearson's r (1) could be used as the data is normally distributed and the relationship is linear (1). This means it could be accepted as quasi-interval (1).</p> <p>OR</p> <p>Spearman's ρ (1) should be used as the data is normally distributed and the relationship is linear (1). Parametric tests can be used only with interval-level data (1).</p>

7. **1 mark for each point:**

- The result is not significant at the 5% significance level.
- This is because the calculated value of t (1.946) is less than the critical value in the table ($t_{(18, 0.05)} = 1.734$).

8. **1 mark for each reason given for choosing Pearson's r (sub-max. 2 marks):**

- The researcher is testing for a relationship between variables.
- The data is at least at the interval level, so a parametric test is appropriate.
- Acceptable alternative justifications.

1 mark for each point about significance (sub-max. 2 marks):

- The result is significant at the 1% level.
- This is because the calculated value of r (0.579) is greater than the critical value in the table ($r_{(24, 0.01)} = 0.529$), two-tailed, $df = 24$).
