# Terms and Conditions of Use

## Terms and Conditions

Please note that the **Terms and Conditions** of this resource include points

**"You acknowledge that you rely on your own skill and judgement in determining the suitability of the Goods for any particular purpose"**

"We do not warrant: that any of the Goods are suitable for any particular purpose (or for a particular qualification), or the results that may be obtained from the use of any particular Goods, or that we are affiliated with any educational institution, or that any Goods are associated with, sponsored by or endorsed by any educational institution"

## Copyright Information

Every effort is made to ensure that the information provided in this publication is accurate. The publisher's legal responsibility is not accepted for any errors, omissions or misleading statements. The publisher has made every effort to obtain permission from any copyright material in their publications. The publisher has arranged to pay any copyright holders whom it has not been possible to contact.

Students and teachers may not use any material or content contained herein as part of their work without referencing/acknowledging the source of the material ("Plagiarism").

## Disclaimers

This publication is designed to supplement teaching only. Practice questions may be based on the content of a specification and may also attempt to prepare students for the type of questions in the examination, but will not attempt to predict future examination questions. The publisher makes no warranty as to the results that may be obtained from the use of this publication or content of the publication.

Where the teacher uses any of the material from this resource to support examination preparation, the teacher must ensure that they are happy with the level of information and support provided, their personal point of view and to the constraints of the specification and to others in the course. It is considered essential that the teacher adapt, extend and/or censor the material to suit their needs, the needs of the specification and the needs of the students. In such cases, the teacher must determine which parts of the material, if any, to provide to students to use as background information for themselves. Likewise, the teacher must ensure that the material is required to cover all points on the specification and to cover each specification point.

ZigZag Education is not affiliated with Pearson, Edexcel, OCR, AQA, WJEC, CEA, or any other Examination Organization or DFE in any way nor is this publication authorised by, associated with or endorsed by these institutions unless explicitly stated on the front cover of this publication.

# Teacher's Introduction

## Overview

This resource has been produced to support teaching and learning of the OCR GCSE Food Preparation and Nutrition specification. The learning content is covered by the following sets of keywords with a range of activities to meet all of the Learning Aims for the following topics:

- Balanced diet and guidelines
- Major diet-related health issues
- Nutritional and dietary needs of different groups of people
- Nutritional needs when selecting recipes for different groups of people
- Energy balance
- Protein (macronutrients)
- Fat (macronutrients)
- Carbohydrate (macronutrients)
- Vitamins (micronutrients)
- Minerals and water (micronutrients)
- Food source and sustainability
- Food production and production part 1
- Food production and production part 2
- Food security part 1
- Food security part 2
- Technological developments in food production
- Development of culinary skills
- Personal, social, economic and cultural influences
- Religious, cultural, ethical and environmental influences
- Reasons why food is important
- Heat transfer and cooking methods
- Functional and chemical properties of carbohydrates
- Functional and chemical properties of fats
- Sensory properties
- Conditions for bacterial growth and food spoilage
- Microorganisms in food
- Buying and storing food
- Preparing and cooking food

For each set, there are a number of different keyword activities on CD designed to give you a range of activities to use in the classroom, homework and revision. This variety enables you to take a different approach to the Crosswords as homework for one topic, and the Match Up as a starter for another.

Alternatively, differentiate the activity for a given topic; for example, you might want to use the **Crosswords** early on while you start weaker learners on the **Match Up** (where terms are matched to definitions). The **Domino** and **Bingo** activities add an element of fun and reinforcement, as well as potential for differentiation. The **Flash Cards** come into their own for revision and the **Table Fill** and **Write Your Own** activities help to reinforce understanding by correctly filling in keywords or definitions.

For more information about the different activities included, see overleaf →

## Digital Format!

All of the activities are provided electronically on the accompanying CD. To use on a school network, the entire contents of the CD needs to be copied and pasted into an accessible location.

Providing easy access to the activities are two HTML menus:

### 1. Access All Menu

Location: [index.html](#)

This menu, designed primarily for teacher use, includes links to everything on provided on the CD – allowing you to easily select what you need when preparing your lessons.

If you intend to give learners access to this menu, then be aware that it does include links to the solutions.

### 2. Interactive Crossword Menu

Location: [interactive-crosswords/index.html](#)

This menu, which can be accessed via the **Access All** Menu, is designed to allow learner access to just the interactive crosswords (without the answers).

## Free Updates!

Register your email address to receive any future free updates\* made to this resource or other Food Preparation and Nutrition resources your school has purchased, and details of any promotions for your subject.

\* resulting from minor specification changes, suggestions from teachers and peer reviews, or occasional errors reported by customers

Go to [zzed.uk/freeupdates](http://zzed.uk/freeupdates)

## Activity Types

All activities are provided as PDF files, allowing for easy printing and sharing on VLE. In addition, each of the single-page activities (*crosswords*, *match up* and *dominoes*) are provided on paper too.

The activities included in this resource are as follows:

### Bingo

Each student is given a different bingo card containing a selection of words from the topic. The teacher reads the definitions using the Keyword Answers and the student must match the words on their card to complete rows, columns, and the full bingo card.

### Crosswords

These traditional keyword activities are especially effective as lesson or homework – and are also an excellent way to bring students into their revision programme.

In addition to the photocopiable worksheets and pdf, the crossword activities are also available in a digital format on the accompanying CD-ROM. These are web-based (HTML) and can be accessed through your Internet browser.

### Dominoes

This is essentially another match-up activity, but this one is designed to be used to engage students. It is recommended that students work in pairs or small groups.

Half of each card contains a keyword, and the other contains a description. To complete the activity, students must align all the cards in the correct order. There is a 'Start' and a 'Finish', meaning if the chain is not complete outside of the chain, then students have gone wrong somewhere.

### Match Up

Students match descriptions to their keyword by drawing lines between them. As there are similar descriptions and keywords, students are likely to make the occasional mistake. While completing the activity, so it is recommended that they use a pencil to start with. Once they are confident with the keywords that they are familiar with, students can then think about and learn the ones they are less confident with.

### Flash Cards

These are a helpful revision tool. To make the cards, fold the page in half, then glue the edges together so the keyword is on one side and the definition the other. In addition to the cards, there are instructions on how to play a game of pairs. Cut each card in two and place face down on the table. Students will then take it in turns to turn over two cards with the aim of matching the keyword and definition. Matched up cards are removed and the game is finished when all the cards have been matched.

### Table Fill

Nothing fancy – students simply write the keyword which is being described, with no other help. Because this activity tests students' own knowledge, it is best used as a homework activity at the end of each topic or during revision. This then acts as a good way to test the key terms for each topic. Alternatively, they could be given to students to see what they already know.

### Write Your Own Glossary

Like the Table Fill, this activity can be used to test pupils before learning a topic or after learning a topic. Students are given a list of the keywords and need to provide definitions. Using Table Fill and Write Your Own Glossary, lessons can be differentiated to suit the needs of all students.

## Table of Topics

	Keyword Titles
1	Balanced diet and guidelines
2	Major diet-related health issues
3	Nutritional and dietary needs of different groups of people
4	Nutritional needs when selecting recipes for different groups of people
5	Energy balance
6	Protein (macronutrients)
7	Fat (macronutrients)
8	Carbohydrate (macronutrients)
9	Vitamins (micronutrients)
10	Minerals and water (micronutrients)
11	Food source and supply
12	Food processing and production part 1
13	Food processing and production part 2
14	Food security part 1
15	Food security part 2
16	Technological developments to support better health and food production
17	Development of culinary traditions
18	Personal, social, economical and medical reasons
19	Religious, cultural, ethical and moral beliefs
20	Reasons why food is cooked
21	Heat transfer and cooking methods
22	Functional and chemical properties of proteins, fats and carbohydrates
23	Functional and chemical properties of fruit, vegetables and raising agents
24	Sensory properties
25	Conditions for bacteria, mould and yeast growth, and signs of food spoilage
26	Microorganisms in food production
27	Buying and storing food
28	Preparing and cooking food

## Balanced diet and guidelines

### Across

- 3 Dietary guideline which recommends eating around 400 g of vegetables and fruit a day, divided into five portions. (4,1,3)
- 4 State in which a lot of adipose tissue is accumulated in the body. (7)
- 8 A person who doesn't eat enough is likely to be \_\_\_\_\_. (14)
- 11 Movement of the body which requires energy expenditure. (8,8)
- 12 Ratio of body mass to height squared ( $\text{kg m}^{-2}$ ) used to assess whether someone's weight is optimal for their height. (4,4,5)

### Down

- 1 Sugars added to food, other than naturally occurring sugars, should be limited.
- 2 A healthy, \_\_\_\_ diet should limit added carbohydrates. (8)
- 5 Sugar naturally occurring in food.
- 6 State in which excess energy from macromolecules and micronutrients leads to diet-related health problems.
- 7 Low-activity lifestyle.
- 9 Simple sugar present in many foods.
- 10 The \_\_\_\_ Guide in the UK recommends eating more food rich in carbohydrates and fruit. (7)

## Major diet-related health issues

### Across

- 1 Condition caused by iron deficiency or an inability to properly ingest it. (4,10,7)
- 7 Condition in which cholesterol plaque accumulates in blood vessels. (15)
- 9 The organ which produces hormones that regulate blood sugar levels. (8)
- 11 Damage to enamel that may be caused by consuming too many sugary foods and drinks. (5,5)
- 13 Also known as a 'brain attack'. This is often caused by a diet high in saturated fats. (6)
- 14 Condition in which the joints become swollen and painful. (9)
- 15 State in which insufficient amounts of macro- and micronutrients are provided. (12)
- 16 \_\_\_ heart disease often causes chest pain AKA angina. (8)
- 17 High blood pressure. (12)

### Down

- 2 Inflammation of the large intestine, which often requires a low-fiber diet.
- 3 Hormone which helps regulate blood sugar levels.
- 4 The risk of \_\_\_ cancer increases if you don't eat enough fiber.
- 5 A person who suffers from a chronic condition.
- 6 Vessels which pump blood from the heart to the rest of the body.
- 8 A disease that is characterized by a loss of muscle strength, often due to a diet low in protein. (12)
- 10 Mammary gland that produces milk.
- 12 Ability to protect the body from disease.

## Nutritional and dietary needs of different groups of people

### Across

- 3 A \_\_\_\_\_ for children is smaller than for adults. (7,4)
- 6 The British Nutrition Foundation states that these sugars should provide less than 5% of daily calorie intake. (4)
- 7 The government produces guidelines for consumption of this, measured in units, to keep health risks to a minimum. (7)
- 10 A person who doesn't eat properly is likely to be \_\_\_\_\_. (12)
- 12 Milk to feed a baby is produced by the breasts in the process called \_\_\_\_\_. (9)
- 13 To stay healthy, one must eat a \_\_\_\_\_ diet. (8)
- 15 Food which provides a lot of energy in \_\_\_\_\_ is energy \_\_\_\_\_. (5)
- 17 Children often \_\_\_\_\_ to make their parents buy them sweets. (7,4)
- 18 Condition (usually acquired) in which milk sugar cannot be digested properly, causing bloating, stomach ache and diarrhoea. (7,11)
- 20 The maximum bone density, reached during adolescence and early adulthood, thanks to calcium accumulation. (4,4,4)

### Down

- 1 Protein in cereals that causes an autoimmune reaction. (7)
- 2 Chemical substance that regulates the growth of the body, needed in small amounts. (7)
- 4 Amount of disposal of different goods, e.g. food, clothing, etc. (7)
- 5 Person who cannot tolerate certain foods. (7)
- 6 There are two types of cholesterol, one of which can reduce cholesterol levels. (7)
- 8 \_\_\_\_\_ include three groups of nutrients that the organism in large amounts. (7)
- 9 Period in which the body is growing. (6,5)
- 10 \_\_\_\_\_ increases the risk of osteoporosis in women. (12)
- 11 Process of supplying the body with nutrients. (9)
- 14 The medical term for a condition where the body cannot absorb certain nutrients. (7)
- 16 Mineral necessary for the formation of bones and teeth. (7)
- 19 \_\_\_\_\_-3 is an essential fatty acid found in oily fish. (5)

INSPECTION COPY

COPYRIGHT  
PROTECTED

## Nutritional needs when selecting recipes for different groups

### Across

- 1 A \_\_\_\_ table contains all the data about a product or ingredient. (4)
- 5 Chemicals needed by the human organism in small amounts. (14)
- 6 Polysaccharide in pasta or grains. (6)
- 7 Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts, from various sources. (7,4)
- 8 Polysaccharide which slows down sugar ingestion (5)
- 10 Organic macromolecules produced by plants during photosynthesis, present in many food products in the form of simple or complex molecules. (5)
- 11 The \_\_\_\_ \_\_\_\_ lowered by cooking. (11,5)

### Down

- 2 To track one's eating habits, a record of the food eaten in a \_\_\_\_
- 3 Chemical substances that provide energy and providing energy
- 4 Amount of food eaten in a day, depending on a person's age, sex, and activity level
- 6 Fats present in solid form at room temperature
- 9 State in which substances are broken down into nutrients and water

INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Energy balance

### Across

- 3 Bread and pasta are an important energy \_\_\_\_\_. (6)
- 4 The way in which a person lives and how active a person is, which significantly affects energy needs. (9)
- 7 Food which provides many calories in one gram. (6-5,4)
- 8 Acronym for the amount of energy needed to perform life activities. (3)
- 10 Nutrient provided in large amounts in wholemeal bread, other than fibre and group B vitamins. (2)
- 12 Macromolecules present in high concentrations in fish, meat and oily products. (8)
- 13 Unit used to measure energy, equals to 0.24 kilocalories. (9)

### Down

- 1 Condition diagnosis. (4)
- 2 Macromolecules found in nuts, seeds and fish. (4)
- 3 A \_\_\_\_ source of energy only if other sources are available. (4)
- 5 Situation in which energy intake and expenditure are equal. (4)
- 6 A unit used to measure energy, count the \_\_\_\_\_. (4)
- 8 A \_\_\_\_ source of energy that can be used to provide energy. (4)
- 9 What happens to energy balance when energy intake is negative – more energy is expended than is consumed in the diet. (6,4)
- 11 Acronym for the amount of energy needed to keep alive. (3)

INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Protein (macronutrients)

### Across

- 1 Disease caused by protein deficiency. (11)
- 6 \_\_\_\_ amino acids can be built by the human body from available resources. (3-9)
- 12 A by-product of extracting oil from soya beans, usually in the form of chunks. (8,9,7)
- 13 Amino acids which cannot be produced by the human body from scratch and have to be provided as a part of a healthy diet. (9,5,5)
- 14 The process of combining rice and peas. (7,15)
- 16 Type of protein in which some of the essential amino acids are in low amounts and lacking, usually of plant origin. (3,10,5)
- 17 Soya, tofu and tempeh are examples of protein \_\_\_\_\_. (12)

### Down

- 2 Nitrogen-based molecules that form the backbone of protein chains. (5,5)
- 3 Protein-rich products of fungi. (11)
- 4 What happens to proteins when they are heated or aggregated, e.g. as in cooking? (11)
- 5 A process that happens when proteins are heated to high temperatures, in the presence of mechanical action, leading to the loss of their natural shape. (11)
- 7 The only plant which is a complete protein. (11)
- 8 Protein alternative to meat. (11)
- 9 The main function of proteins is to provide the building blocks for the repair of body tissues. (11)
- 10 Soya and meat are sources of complete protein. (4,10)
- 11 Tiny, easy-to-digest protein-rich seeds from South America, high in protein and fibre, and used in many dishes. (11)
- 15 Traditional Japanese dish made from soybeans, used for sauces and as a meat substitute. (11)

## Fat (macronutrients)

### Across

- 1 The type of fat present in fish oil. (15)
- 6 Fatty substance necessary for building cell membranes and bile in the gall bladder. (11)
- 7 The only animal-derived fat which is liquid at room temperature. (4,3)
- 8 An energy-dense macromolecule built from glycerol and three chains of acids, necessary for building hormones and insulating the body. (3)
- 9 A mixture of oil and water. (8)
- 15 One of the first signs of fat deficiency in diet. (6,4)
- 16 There are three chains of \_\_\_\_\_ in a fat molecule. (5,5)
- 17 The 'good' fat of cholesterol (abbr). (3)
- 18 Fats produced when oils are cooked at a high temperature. (5)
- 21 Type 2 \_\_\_\_\_ is a disease in which high blood sugar levels may cause health complications. (8)
- 22 Connective tissue whose main function is to store energy, and insulate and cushion organs. (7,6)

### Down

- 2 The 'bad' fraction
- 3 Type of fat prese
- 4 Fatty acids which from scratch and healthy diet. (9,5)
- 5 Type of fat where present in the fat
- 10 \_\_\_\_\_ fats include (9)
- 11 Butter, sunflower fats. (7)
- 12 The type of fat pr
- 13 Condition in whic tissue are stored excessive intake
- 14 Scientific name f
- 19 Hard animal fat u feed birds. (4)
- 20 Group of chemical acids, triglyceride insoluble in water

## Carbohydrate (macronutrients)

### Across

- 2 Long carbohydrate chain. (14)  
 8 Flour which is made of whole grains. (9)  
 9 Disaccharide present in milk. (7)  
 11 Simple sugar found in milk. (9)  
 12 \_\_\_ fibre swells in the stomach and increases the feeling of satiety. (7)  
 13 Carbohydrate whose consumption should be limited. (5)  
 15 Carbohydrates built from one molecule only, such as fructose and galactose. (15)  
 16 Sugars which naturally occur in fruit are called \_\_\_  
 18 Simple sugar naturally present in fruit (8)  
 19 Type of carbohydrate built from two molecules of sugar, such as lactose and sucrose. (12)

### Down

- 1 Primary source of energy in a balanced diet. (13)  
 2 Type of soluble fibre which acts as a laxative agent. (6)  
 3 Cellulose and lignin  
 4 Simple sugar which is found in honey  
 5 The chemical name of glucose. (7)  
 6 One of the first nutrients to be added to a diet. (6,4)  
 7 Polysaccharide reserve in the liver  
 10 Substance occurring in plants for humans but not for animals  
 13 Carbohydrate occurring in plants  
 14 \_\_\_ sugar is added to soft drinks and is not limited. (4)  
 15 The chemical name of the disaccharide in milk  
 17 Tooth \_\_\_ may be damaged by acids

INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Vitamins (micronutrients)

### Across

- 3** A pill or capsule taken to top up micronutrient levels in the body and improve overall health. (10)
- 6** The gut bacteria. (10)
- 7** Chemical which can stop free radicals from causing damage. (11)
- 10** \_\_\_\_ acid is the vitamin found in large amounts in fruit and vegetables. (8)
- 11** The chemical name for vitamin E, found in vegetable oils and oily fish. (10)
- 15** Disease caused by thiamine deficiency, symptoms of which include weakening of the muscles leading to paralysis. (8)
- 16** Condition caused by vitamin C deficiency. (6)
- 18** Scientific name of vitamin B12, found in meat and offal. (9)
- 20** Scientific name of the form of vitamin A present in butter or liver. (7)
- 21** The chemical name for vitamin D, present in large amounts in milk, dairy products and oily fish, and also produced in the skin. (15)
- 22** Organic molecules, some of which can be produced in the body. (8)

### Down

- 1** The chemical name of vitamin C. (7)
- 2** Symptoms of this disease include three Ds: diarrhoea, dermatitis and demineralisation. (10)
- 4** Condition caused by iron deficiency. (5,6)
- 5** Deficiency of this vitamin causes night blindness. (7)
- 8** Eyesight condition caused by a deficiency of vitamin A. (6)
- 9** Harmful particles with free radicals. (4,8)
- 12** In \_\_\_\_ bones become brittle. (5)
- 13** Childhood disease caused by a deficiency of vitamin D. (7)
- 14** \_\_\_\_ anaemia may be caused by a deficiency of iron. (6)
- 17** The chemical name of the mineral crucial for releasing energy from food. (7)
- 18** Beta-\_\_\_\_ is the scientific name of the form of vitamin A present in carrots. (7)
- 19** \_\_\_\_ acid is the vitamin found in spinach. (5)

INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Minerals and water (micronutrients)

### Across

- 3** The hardest tissue in the human body. (6)
- 5** Chemical element found in milk, dairy products and bony fish, necessary for the proper development and growth of bones and teeth. (7)
- 7** Condition caused by a deficiency of micronutrients, in particular iron, vitamin B12 and folate, characterised by low red blood cell levels. (7)
- 8** Condition in which the thyroid gland is enlarged. (6)
- 11** When not enough water is drunk. (11)
- 14** Non-haem \_\_\_\_ is found in plant foods such as spinach and broccoli. (4)
- 15** Function of water whereby harmful substances are removed from the body. (5)
- 17** Blood protein \_\_\_\_ is responsible for transporting oxygen. (11)
- 19** \_\_\_\_ chloride is a white crystalline substance with a salty taste. (6)
- 20** Small gland in front of the neck which produces hormones necessary for proper metabolism. (7,5)
- 22** Invertebrate marine organisms used as food which is rich in protein and iodine. (9)
- 23** High blood pressure. (12)

### Down

- 1** Process in which drugs are broken down in the body. (5,5)
- 2** Trace element needed for the production of thyroid hormones. (6)
- 4** Condition caused by a deficiency of iron, where the blood becomes thin and the brain is affected. (5,12)
- 6** Salty secretion on the skin. (6)
- 9** One of the elements found in the structure of bones, but also in the blood. (10)
- 10** Condition caused by poor hygiene, where enamel is damaged by bacteria. (5,5)
- 12** Brittle bone disease. (6)
- 13** Inorganic chemical compounds that, when dissolved in water, conduct electricity. (5,5)
- 16** \_\_\_\_ often affects the thyroid gland. (6)
- 18** Microelement needed for the production of thyroid hormones. (6)
- 21** Cheese, yoghurt or milk. (6)

INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Food source and supply

### Across

- 1 Eggs which are labelled 1. (4,5)
- 4 Nutrient-rich mixture used to enhance soil quality. (10)
- 7 One of the most ancient ways of obtaining food, today it is performed for amusement. (7)
- 9 Part of the DNA strand which codes for a single piece of information. (4)
- 10 \_\_\_ foods include turkey in winter and strawberries in spring. (8)
- 11 Transporting goods from another country. (6)
- 12 All the animals reared on a farm. (9)
- 13 Meat of domesticated birds, such as chicken, etc. (7)
- 14 Food product grown or reared without the use of chemicals or GM components. (7)
- 16 Where food comes from and how it is made. (10)
- 17 Specially built place in which fish are reared. (4,4)
- 18 Animal \_\_\_ concerns the conditions in which animals are kept. (7)
- 19 Method of growing plants in which roots are dipped directly into water. (10)
- 20 Spiral molecule locked in the nucleus of a cell, which carries all the information about a person, animal or plant. (3)

### Down

- 2 Foods made from a variety of ingredients. (6)
- 3 Plant or animal which is used to obtain or produce a product. (7)
- 5 Chemical substance which is used to prevent food from spoiling the contents. (7)
- 6 Deer meat. (7)
- 8 \_\_\_ protect plants from the effects of temperature fluctuations. (11)
- 9 Examples of this type of food are herbs. (8)
- 10 Food product which is the basis of a region's economy, climate and weather. (7)
- 15 Meat of caught animals. (7)

INSPECTION COPY

## Balanced diet and guidelines (Match Up)

1	Condition in which abnormally high levels of adipose tissue are stored in the body, usually cause excessive intake of macronutrients.
2	Diet which provides the correct quantity and quality of macro- and micronutrients to support health and well-being.
3	Dietary guideline in the shape of a plate which indicates five categories of food product and how much of each of them should be eaten.
4	Dietary guideline which recommends eating around 400 g of vegetables and fruit a day, divided into five portions.
5	Habits and behaviours which include little or no physical activity.
6	Movement of the body which requires energy expenditure.
7	Ratio of body mass to height squared ( $\text{kg/m}^2$ ), used to assess whether someone's weight is optimal for their height.
8	Simple sugar which is a basic source of energy for all of the cells around the human body.
9	State in which excessive amounts of macro- or micromolecules are provided, which may lead to related health conditions.
10	State in which insufficient macro- and micronutrients are provided, often leading to weight loss caused by nutrient deficiency.
11	Sugars added to food products, as opposed to those naturally occurring in foods, consumption of which should be limited to remain healthy.
12	Sugars naturally occurring in food products, as opposed to free sugars.

## Major diet-related health issues (Match Up)

1	Abnormally high blood pressure, characteristic of cardiovascular diseases.
2	Chronic disease caused by insufficient performance of insulin, in which abnormally high blood sugar levels occur.
3	Condition caused by iron deficiency or an inability to properly ingest it.
4	Condition in which bones lose their density and become fragile and easy to break.
5	Condition in which crystals accumulate in joints, causing swelling, pain and difficulty walking, or the effect of unhealthy diet and obesity.
6	Condition in which enamel is damaged by bacteria.
7	Condition in which heart blood vessels are narrowed by the accumulation of cholesterol plaque leading to heart attack.
8	Condition in which veins and arteries are narrowed due to cholesterol plaque accumulation.
9	Important hormone, produced in the pancreas, which is responsible for lowering blood sugar levels.
10	Important organ which produces enzymes which are necessary for proper digestion and hormones to regulate blood sugar levels.
11	Inflammation of the pouches within the large intestine, which causes painful symptoms and requires a high fibre diet to minimise them.
12	Mammary gland tumour, for which risk factors include obesity, drinking alcohol and lack of exercise, as well as hormonal issues and gene mutations.
13	State in which blood is not provided to the brain or massive bleeding occurs in the brain, causing death to the brain cells.
14	State in which insufficient amounts of macro- and micronutrients are provided.
15	The blood vessels which pump blood to the heart.
16	The body's defence system, protecting it from infections and fighting off bacteria and viruses.
17	Tumour of the lower digestive tract, for which risk factors include low consumption of dietary fibre and an unhealthy diet.

## ***Nutritional and dietary needs of different groups of people (Match Up)***

1	Amount of disposable income which a family can spend on different goods, e.g. food or entertainment
2	Amount of food eaten in one meal, usually differing depending on a person's age, sex and body size
3	Chemical substances necessary for building the body and providing energy, needed in large amounts
4	Chemical substances necessary for the proper functioning of the body, needed in small amounts
5	Children's ability to pressurise their parents into buying them sweets, toys or other items.
6	Condition (usually acquired) in which milk sugar cannot be digested properly, causing bloating, sickness and diarrhoea.
7	Condition caused by iron deficiency or inability to properly ingest it.
8	Consumption of this type of sugar should be limited to less than 5% of daily calorie intake.
9	Disease characterised by immune reaction to gluten, leading to damage of the villi in the intestine and nutrient malabsorption.
10	Essential fatty acids, present in large amounts in fish, with double bonds located at the third carbon from the end of the fatty acid chain.
11	Food which provides many calories in one gram.
12	Glycaemia, or the amount of glucose present in the blood.
13	Inorganic substance produced by the fermentation of sugars that is damaging to the health if too much is drunk.
14	Natural process in a female body which increases the need for iron, as otherwise anaemia may occur.
15	Period in which the body grows rapidly, i.e. in early childhood and during adolescence.
16	Process and period of time during which mammary glands produce milk to feed a baby.
17	Process of supplying a sufficient level of water in the body.
18	Protein which is present in some cereals, such as wheat, rye or barley, and which cannot be eaten by people with coeliac disease.
19	Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts to allow proper functioning of the human body.
20	State in which insufficient amounts of macro- and micronutrients are provided.
21	Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and reducing the risk of bowel cancer.
22	The maximum bone density, reached during adolescence and early adulthood, thanks to calcium intake.

## ***Nutritional needs when selecting recipes for different groups of people***

1	Amount of food eaten in one meal, usually differing depending on a person's age, sex and body size.
2	Amount of macro- and micronutrients present in a given food, ingredient or meal.
3	Chemical substances necessary for building the body and providing energy, needed in large amounts.
4	Chemical substances necessary for the proper functioning of the body, needed in small amounts.
5	Digestible polysaccharide present in rice, bread or pasta, built from long chains of glucose particles together.
6	Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.
7	Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts from various sources.
8	State in which sufficient, appropriate amounts of nutrients and water are provided.
9	Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and thus the risk of bowel cancer.
10	Table which shows detailed nutritional information about food products and ingredients.
11	Type of fats in which all the chemical bonds are single, present in large amounts in lard or butter.
12	Type of notes or calendar in which all foods eaten during a certain period of time are written in order to assess one's diet or eating habits.

## Energy balance *(Match Up)*

1	Amount of energy necessary for conducting basic life functions, such as breathing or heartbeat.
2	Condition in which abnormally high levels of adipose tissue are stored in the body, usually cause excessive intake of macronutrients.
3	Easily available source of energy which is used as a first resort.
4	Food rich in certain macromolecules, such as carbohydrates or fats, which is consumed mainly to provide energy.
5	Food which provides many calories in one gram.
6	Group of macronutrients which should constitute around 15% of daily calorie intake.
7	Group of macronutrients which should provide around 50% of daily energy intake, usually along with vitamins and dietary fibre.
8	Indicator of the amount of energy needed to perform all life activities, such as walking, running, swimming, etc.
9	Situation in which energy consumption and expenditure are equal.
10	Source of energy which is used only if other resources are unavailable.
11	The way in which a person lives and how active a person is, which significantly affects energy needs.
12	Triglycerides – energy-dense macromolecules present in a range of foods, which should provide around 9 kcal/g of daily calorie intake.
13	Unit used to measure energy, equals to 0.24 kilocalories.
14	Unit used to measure energy, which equals approximately 4,184 joules.
15	What happens to the body when the energy balance is negative – more energy is burnt than is provided in the diet.

## Protein (macronutrients) (Match Up)

1	A by-product of extracting oil from soya beans, usually in the form of chunks.
2	A process that happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
3	Amino acids which can be built by the human body from available resources.
4	Amino acids which cannot be produced by the human body from scratch and have to be provided in a healthy diet.
5	Combining two or more low biological value proteins in order to produce a high biological value protein.
6	Condition caused by prolonged deficiency of protein, occurring especially in developing countries and characterised by swelling of the stomach.
7	Long chains of amino acids that are the building blocks of the body, support growth and development, and make up 15% of a balanced diet.
8	Nitrogen-based molecules that bind together to form a chain of peptides.
9	Protein alternative made from coagulated soya milk pressed together into soft blocks, characteristic of Indian cuisine and also known as bean curd.
10	Protein-rich product made by <i>Fusarium venenatum</i> fungi.
11	Protein-rich products made without the use of animal-derived ingredients.
12	Tiny, easy-to-digest, gluten-free grains originating from South America, rich in carbohydrates, protein, fibre, and used as a protein alternative.
13	Traditional Japanese paste made of fermented soya, used for sauces and spreads.
14	Type of bean rich in high biological value protein, used for manufacturing many other products, such as oil, sauce or cheese-like products.
15	Type of protein in which all essential amino acids are present in the correct amounts; usually of animal origin.
16	Type of protein in which some of the essential amino acids are in low amounts or lacking; usually of plant origin.
17	What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.

### ***Fat (macronutrients)*** *(Match Up)*

1	A fat which is naturally present in foods and which can be seen in the form of fatty tissue or oil.
2	A fat which is naturally present in foods and which cannot be seen before extraction.
3	A mixture of oil and water.
4	An energy-dense macromolecule built from glycerol and three chains of acids, necessary for building hormones and insulating the body.
5	Chronic disease characterised by high blood sugar levels, often developing as a result of high fat obesity.
6	Condition in which abnormally high levels of adipose tissue are stored in the body, usually cause excessive intake of macronutrients.
7	Connective tissue whose main function is to store energy, and insulate and cushion organs.
8	Fatty acids which cannot be built by the human body from scratch and have to be provided as a part of a healthy diet.
9	Fatty substance necessary for building cell membranes and bile in the gall bladder.
10	Group of chemical substances which include fatty acids, triglycerides, waxes and sterols, and which are insoluble in water.
11	High-density fraction of cholesterol which transports fats from the blood to the liver, and lowers cholesterol levels.
12	Low-density fraction of cholesterol which transports fats around the body and to the cells.
13	One of the first signs of fat deficiency in a diet, which sees a decrease in body weight.
14	The chemical name for a fat molecule.
15	The only animal-derived fat which is liquid at room temperature.
16	Three long hydrocarbon chains attached to a glycerol particle to form a molecule of fat.
17	Type of fat in which all the chemical bonds are single.
18	Type of fat in which one or more double chemical bonds are present.
19	Type of fat where more than one double chemical bond is present in the fatty acid chain.
20	Type of fat where only one double chemical bond is present in the fatty acid chain.
21	Type of fats which are produced as a result of heating oils to high temperatures for a long time.
22	Visible fat surrounding the loins and kidneys of cows and sheep, high in saturated fats and characteristic of traditional British cuisine.

## Carbohydrate (macronutrients) (Match Up)

1	A simple sugar built from five atoms of carbon, naturally occurring in fruit.
2	Carbohydrate which is built from large numbers of molecules bound together into long chains.
3	Carbohydrates built from one molecule only.
4	Carbohydrates built from two particles of sugars, examples of which are lactose and sucrose.
5	Commonly used sweet substance built from one molecule of glucose and one molecule of fructose from sugar beet and sugar cane.
6	Condition in which enamel is damaged by bacteria, causing pain and trouble eating.
7	Disaccharide built from two molecules of glucose, obtained from germinating grains.
8	Disaccharide present in milk.
9	Flour made from whole grains, without separating the bran.
10	Large organic macromolecules produced by plants during photosynthesis, and which include sugars and fibre.
11	Monosaccharide which, together with glucose, forms a molecule of milk sugar.
12	One of the first noticeable signs of carbohydrate deficiency in a diet, seeing a decrease in body weight.
13	Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.
14	Organic macromolecules produced by plants, bound into long chains in order to store energy for later use.
15	Polysaccharide stored in the liver and muscle cells which is an emergency source of energy.
16	Simple sugar which is a basic source of energy for all of the cells around the human body.
17	Substance occurring in plant cells only, usually indigestible for humans but necessary for maintenance of plant cells.
18	Sugars added to food products, as opposed to those naturally occurring in foods.
19	Sugars that occur naturally in food products, as opposed to free sugars.
20	Type of fibre which absorbs water and enhances bowel movements, usually in the form of cellulose.
21	Type of fibre which swells in the stomach giving the feeling of satiety, usually in the form of pectin.
22	Type of soluble fibre, present in fruit, which acts as a gelling agent.

## Vitamins (micronutrients) (Match Up)

1	A pill or capsule taken to top up micronutrient levels in the body and improve overall health.
2	Atoms or particles which lack electrons and steal them from other particles, causing damage and stress.
3	Bacteria living in the intestines, where they aid digestion and produce vitamins, e.g. vitamin K.
4	Chemical substance or molecule which has the ability to stop and prevent the damage caused by
5	Childhood disease caused by an imbalanced, micronutrient-deficient diet.
6	Condition caused by folate deficiency during the prenatal period.
7	Condition in which bones lose their density and become fragile and easy to break.
8	Disease caused by niacin deficiency, characterised by sensitivity to sunlight.
9	Disease caused by thiamine deficiency, symptoms of which include weakening of the muscles leading to paralysis.
10	Disease caused by vitamin C deficiency, the main symptoms of which include receding and bleeding gums and tooth loss.
11	Eyesight condition caused by vitamin A deficiency.
12	Form of vitamin A found in animal-derived foods.
13	Form of vitamin A found in fruit and vegetables.
14	Organic molecules needed in very small amounts, usually provided by the diet but some can also be synthesised in the body.
15	The chemical name for a water-soluble vitamin which is crucial for releasing energy from foods (carotene).
16	The chemical name for vitamin B1, deficiency of which causes beriberi disease.
17	The chemical name for vitamin B12, found mainly in meat, offal and egg yolk.
18	The chemical name for vitamin B3, necessary for releasing energy from food, found in lean meat, poultry and fish.
19	The chemical name for vitamin B9, crucial for proper development of the spinal cord and for the production of red blood cells.
20	The chemical name for vitamin C, found mainly in fruit and vegetables, such as potatoes, blueberries and citrus fruits.
21	The chemical name for vitamin D, present in large amounts in milk, dairy products and oily fish, and also produced in the skin.
22	The chemical name for vitamin E, found in vegetable oils and oily fish.
23	Type of anaemia caused by vitamin B12 deficiency, as opposed to iron deficiency anaemia.

## Minerals and water (micronutrients) (Match Up)

1	Abnormally high blood pressure, usually caused by excessive sodium intake, narrowing of the blood vessels, and certain hormones.
2	An electrolyte – an element necessary for properly conducting electrical impulses and regulating body fluid balance.
3	Chemical element found in milk, dairy products and bony fish, necessary for the proper development and growth of bones and teeth.
4	Chemical trace element necessary for the proper development of tooth enamel.
5	Condition caused by a deficiency of micronutrients, in particular iron, vitamin B12 and folate, which leads to anemia and low red blood cell levels.
6	Condition caused by overhydration, in which electrolytes in the blood become too diluted, resulting in swelling of the brain.
7	Condition caused by improper fluoride intake and bad mouth hygiene, where enamel becomes discolored and weak.
8	Condition caused by iodine deficiency, symptoms of which include swelling of the neck and characteristic goiter.
9	Condition in adults in which bones lose their density and become fragile and easy to break.
10	Element necessary for building red blood cells, which is easily ingested from meat and eggs but is harder to ingest from plant-derived foods.
11	Function of water whereby harmful substances are removed from the body.
12	Inorganic chemical element necessary for the body to build cells, conduct electric impulses or build bones.
13	Invertebrate marine organisms used as food which is rich in protein and iodine.
14	Liquid, salty secretion from glands located mainly in the armpits and from skin pores all over the body.
15	One of the elements necessary for the proper mineralisation of bones, but also needed to release energy during metabolism.
16	Process in which drinking water is enriched in fluoride.
17	Products made from milk, often high in calcium.
18	Red pigment in blood cells, built from four peptide chains attached to iron atoms, responsible for carrying oxygen in the body.
19	Serious condition in which the body cannot cool down any more and gets so hot that it becomes life-threatening, e.g. as the result of very hot weather.
20	Small gland in front of the neck which produces hormones necessary for proper metabolism.
21	State caused by excessive loss and insufficient replenishment of water, usually as the result of excessive sweating or exaggerated physical activity.
22	The hardest tissue in the human body, which forms the external part of the teeth.
23	Trace element necessary for building thyroid hormones which regulate the rate of metabolism in the body.

## Food source and supply (Match Up)

1	Activity during which people catch and kill wild animals and birds, often with the use of specially
2	All animals reared on a farm for meat or other purposes.
3	Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
4	Bringing or transporting goods from another country.
5	Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
6	Chemical, nutrient-rich mixture used to enrich and improve soil quality in order to obtain higher
7	Food characteristic of a given time of year.
8	Food product produced without the use of any artificial compounds, pesticides, antibiotics or G fertilisers.
9	Food product which is eaten in large quantities and forms the basis of a regional or national diet to climate and weather conditions allowing the growth and rearing of certain food products only
10	Foods made from animals which were purposely bred in a farm in order to obtain milk, egg, meat benefits.
11	Foods such as mushrooms, herbs, roots and wild fruit which are not farmed but are looked for in
12	Long, transparent plastic tube used in farming in order to provide warmth to plants and protect unfavourable weather conditions.
13	Method of egg production in which hens can move freely outside the barn; eggs from such hens
14	Part of a DNA molecule which carries specific information, such as the colour of a flower or size
15	Plant growing method in which roots are placed into water instead of soil, used to grow lettuces
16	Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable
17	Spiral molecule locked in the nucleus of a cell, which carries all the information about a person, a plant.
18	The idea which advocates humane conditions and treatment for animals.
19	The meat of a deer.
20	The meat of caught animals, such as pheasant, wild boar or rabbit.
21	The meat of domesticated birds, such as chicken, goose, turkey and duck.
22	The origin of food – place where the food comes from and how it is manufactured.

## ***Food processing and production part 1 (Match Up)***

1	A type of fibre which occurs naturally in fruit and which acts as a gelling agent.
2	Acid produced from milk sugar during fermentation of milk.
3	Coagulated milk – one of the steps of cheese production.
4	Disaccharide which occurs naturally in milk and which is transformed into acid during milk fermentation.
5	Early processes in which food is turned from raw produce into ingredients for an edible, saleable product.
6	Furry microorganism which is used in blue cheese production and which causes bread and fruit to go mouldy.
7	Live bacteria added to pasteurised milk to begin the process of fermentation during cheesemaking.
8	Milky liquid, a by-product of cheese production, drained from the cheese and used as a beverage feed.
9	Net-like protein in wheat, rye and barley, responsible for the soft, springy texture of bread.
10	Processes which affect food's properties or turn it into a different product.
11	Raw, unrefined food, usually freshly harvested.
12	Transparent, tasteless substance derived from collagen, used as a gelling agent.
13	Various bacteria species which are beneficial for health and useful in food production.

# INSPECTION COPY

PROTECTED**

## Food processing and production part 2 (Match Up)

1	Dairy product made of the fat layer skimmed off the top of milk before homogenisation.
2	Freezing food and removing moisture afterwards under pressure to enhance shelf life without a nutritional value of a food.
3	Gathering the crops from a field or orchard.
4	Heat treatment of milk and meat preserves in which the food is heated to 130°C for 30 minutes to kill bacteria and spores and significantly increase the shelf life of the finished product.
5	Important step in the production of cheese, in which it is either immersed in or coated with brine to improve its taste and lengthen its shelf life.
6	Preserving method in which cooked food is quickly chilled from 70 to 3 degrees Celsius to prevent bacterial growth and make it safe to eat.
7	Pressing milk through very fine membranes in order to remove bacteria.
8	Process of decreasing the amount of fat in milk.
9	Process of decreasing the size of fat particles in milk by pressing them through tiny holes to obtain a stable emulsion.
10	Process of gently heating a liquid or a food product to 72°C in order to kill harmful bacteria and make it safe to eat.
11	Process of turning milk or cream into butter.
12	Pulverising – turning grain into powder.
13	Storing and packaging food in conditions where oxygen, nitrogen and CO <sub>2</sub> concentrations, air humidity and temperature are carefully regulated.
14	Storing and packaging food in conditions where the composition of air is modified to improve the shelf life and prevent oxidation.
15	Turning milk into yoghurt or cheese with the use of bacteria.

# INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Food security part 1 (Match Up)

1	Ability to produce sufficient amounts of food, ensuring that the ecosystem remains stable and diverse.
2	Able to be broken down in natural conditions, e.g. by bacteria and pests.
3	All food which has not been eaten for various reasons, and has to be disposed of due to spoilage, damage or another reason.
4	Amount of CO <sub>2</sub> released during the production and transportation of a given good, e.g. a food product.
5	CO <sub>2</sub> , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap heat around the Earth and contribute to global warming.
6	Food assurance scheme which ensures food safety, traceability, environmental protection and animal welfare in the UK.
7	Food product produced without the use of any artificial compounds, pesticides, antibiotics or growth regulators.
8	Food characteristic of a given time of year.
9	Invisible, odourless gas produced in large amounts during food production and transportation, contributing to the greenhouse effect and trapping warmth around the Earth.
10	Light, white synthetic material which does not decompose and which is used to insulate and protect food.
11	Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
12	Naturally occurring, usually non-renewable reserves of non-organic or organic matter, such as coal, oil and natural gas.
13	Process of turning a used product (e.g. newspaper) into a new one (e.g. toilet paper).
14	Situation in which the average temperature on Earth rises, causing weather anomalies and melting glaciers.
15	Synthetic, usually elastic compound which is very hard to decompose and which is used to produce plastic packaging.
16	The distance a food has to travel from a farm to the plate of a consumer.

# INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Food security part 2 (Match Up)

1	Accidentally catching fish or other animals which weren't intended to be caught.
2	Amount of CO <sub>2</sub> released during the production and transportation of a given good, e.g. a food product.
3	Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
4	Bringing or transporting goods from another country.
5	Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
6	Chemical substances used to enrich and improve soil quality in order to obtain higher crop yields.
7	CO <sub>2</sub> , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap heat around the Earth and contribute to global warming.
8	Ethical way of trading between developed and developing countries, which allows fair prices and fair conditions for the farmers and farm workers.
9	Ice or snow mass formed at the tops of mountains and near the poles.
10	Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
11	Place where fish are caught or reared, either in the wild or in fish farms.
12	Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable traits.
13	Poor, unindustrialised countries which are attempting to increase their growth rate and quality of life through trading and implementing modern technologies.
14	Situation in which the average temperature on Earth rises, causing weather anomalies and melting glaciers.
15	State in which a person does not provide sufficient amounts of macro- and micronutrients, often leading to health problems.
16	State in which everybody around the world has a sufficient amount of safe, healthy, nutritious food.
17	State in which massive rainfall has occurred for a prolonged period of time, causing rivers to leave their banks and swamp the surrounding land.
18	State in which no rainfall has occurred for a prolonged period of time, causing crop failure and other problems with food production or hygiene.
19	State in which too many fish are caught, leading to the extinction of a given shoal or the extinction of a species.
20	The distance a food has to travel from a farm to the plate of a consumer.
21	Variety of species occurring in the environment.

## Technological developments to support better health and food products

1	A mineral added to plain flour by law to prevent anaemia.
2	A mineral added to plain flour by law to prevent rickets and osteoporosis.
3	A vitamin added to plain flour by law to reduce the risk of pellagra and other effects of its deficiency.
4	A vitamin added to plain flour by law to restore its levels lost during milling, the deficiency of which causes beriberi disease.
5	Addition of nutrients to a given product to improve or restore its nutritional value.
6	Additive used to maintain a food's chemical structure.
7	Agent used to change or enhance the taste and smell of food.
8	Chemical substances containing nitrogen, used in the production of cured meats to prevent the growth of <i>Clostridium botulinum</i> bacteria and improve the colour of the final product.
9	Chemical substances, e.g. vitamin C, added to food products to enhance their shelf life by preventing oxidation.
10	Fatty substance which does not occur in vegetable fats, responsible for many diet-related conditions.
11	Kind of flour which does not have to be fortified because its nutritional value has not been affected by processing.
12	Kind of milk which has to be fortified by law due to its low fat content.
13	Microorganisms (usually bacteria species) which provide health benefits if consumed, present in fermented foods such as sauerkraut or pickled cabbage.
14	Natural or synthetic agent used to enhance the shelf life of a food and prevent spoilage.
15	Natural or synthetic substance used to replace sugar and decrease the calorific value of a food.
16	Naturally occurring molecules found in plant substances which have the potential to lower blood cholesterol levels and decrease the risk of heart failure.
17	Obligatory – necessary to add to a food product by law.
18	Pigment – agent used to change or enhance the visual aspects of food.
19	Plant fibre or another substance which promotes the growth of probiotic bacteria, e.g. inulin found in chicory root.
20	Soft, spreadable mixture made of hydrogenated vegetable oils, used instead of butter, and fortified with vitamins A and D by law.
21	Substance added to fat spreads and skimmed milk by law.
22	Substance such as modified starch used to increase the viscosity of a product.
23	Substance used to improve the texture of food and prevent separation of ingredients.

## Development of culinary traditions (Match Up)

1	A pizza that is folded before cooking.
2	Afternoon nap or rest typical of southern countries such as Spain or Mexico.
3	Britain's most popular traditional hard cheese, made from cow's milk and originating from Somerset.
4	Clay dish with a lid used for prepare traditional Arab meals.
5	Cuisine which is formed from many different ethnic groups, increasing the variety and diversity of cooking methods.
6	Cutlery items used instead of a knife and fork in East Asia.
7	Deep frying pan characteristic of Asia.
8	Food product which constitutes the basis of a daily diet in a region or country.
9	Originating from Italy, a small snack eaten before the main dish to increase the appetite.
10	Round clay oven used for cooking traditional Indian meals.
11	Small snacks or biscuits eaten before noon.
12	Style of cooking characteristic of a country or region, which uses specific ingredients and cooking methods.
13	Style of cooking characteristic of the south of Europe.
14	Traditional British meal consisting of sandwiches, cakes or scones and a pot of tea.
15	Traditional dessert characteristic of Greece and Turkey, made from flaky pastry with a filling traditionally made from nuts, and soaked in syrup or honey.
16	Traditional Japanese dish made of rice, seaweed and fish or vegetables, dipped in soy sauce or wasabi.
17	Traditional Scottish dish made from offal, oats and herbs sealed in an animal's stomach.
18	Traditional Spanish dish made of rice, vegetables, chicken and seafood, usually served in a shallow pan.

## ***Personal, social, economical and medical reasons (Match Up)***

1	A protein present in wheat, rye and barley, and which is a cause of food intolerance.
2	Describes food that is characteristic of a given time of year.
3	Disease in which gluten cannot be digested and a gluten-free diet has to be followed for the person's life.
4	Habits and actions of an individual – the way a person lives.
5	Indicator of the amount of energy needed to perform all life activities, such as walking, running, or showering.
6	Person who buys and eats foods – a client.
7	Process of developing international and intercontinental relations, trade and cultural exchange, to improve food availability and affect food choices of people even in very remote countries.
8	Severe, life-threatening allergic reaction to food or other factors.
9	Situation in which food is present in the market and affordable for the buyers, thanks to modern methods, storage system improvements and imports.
10	The cost of food – the amount of money one has to pay to buy the food.
11	The enzyme which breaks down milk sugar in the small intestine.
12	The negative reaction of the digestive system to a food ingredient, often manifesting as stomach pain and diarrhoea.
13	The reaction of the immune system to a food ingredient, which may lead to anaphylactic shock.
14	The sugar naturally present in milk and one of the most common causes of food intolerance.
15	Unusual or particularly important event; cause for celebration and enjoyment, during which festive drinks are consumed.

**COPYRIGHT  
PROTECTED**

## ***Religious, cultural, ethical and moral beliefs (Match Up)***

1	All actions, traditions, ideas or beliefs characteristic of a country, region or ethnic group.
2	Chemical substance occurring in beverages, forbidden in many religions.
3	Ethical way of trading between developed and developing countries, which allows fair prices and the farmers and farm workers.
4	Farming method which aims at minimising the costs and increasing the yield by the use of modern technologies, pesticides, artificial fertilisers, etc.
5	Food product produced without the use of any artificial compounds, pesticides, antibiotics, GM fertilisers.
6	Foods and other goods which are permissible for Jews.
7	Foods and other goods which are permissible for Muslims.
8	Hindu festival of lights, celebrated in autumn.
9	In Islam, a month-long fasting period during which nothing can be eaten or drunk from sunrise to sunset.
10	Person who is worshipped and whose teachings are followed, e.g. in Sikhism.
11	Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable characteristics.
12	The idea/movement which defines dietary restrictions for Rastafarians.
13	The meat derived from a commonly reared animal, forbidden in many religions, such as Islam or Judaism.
14	The principle of humane treatment and conditions for animals.
15	Type of diet which does not allow consumption of any animal-derived food products.
16	Type of diet which does not allow consumption of meat, and sometimes other animal-derived food products, such as fish, milk or eggs.
17	Variant of vegetarianism which allows the consumption of dairy products.
18	Variant of vegetarianism which allows the consumption of eggs and dairy products.
19	Variant of vegetarianism which allows the consumption of eggs.

## ***Reasons why food is cooked (Match Up)***

1	All actions and procedures taken to ensure that food is not harmful and is secure to eat.
2	Appealing – stimulating craving for a particular food product.
3	Durability – the amount of time during which a food can be safely stored and eaten.
4	Food which is in its natural state, before any heat treatment or processing.
5	Process of breaking down nutrients in the stomach and intestines into a form which can be ingested into the bloodstream.
6	Process of softening and improving the texture of meat and poultry by slow-cooking, cutting it into small pieces using a marinade or a mallet.
7	Term that refers to whether food is pleasurable and agreeable to the palate.
8	The combined sensation of taste, smell and mouthfeel, which can be greatly altered and improved by cooking.
9	The consistency of a food product, usually created or altered during cooking.
10	The smell of food, usually more prominent in hot foods than in cold ones.
11	Tiny, omnipresent microorganisms which can cause food poisoning if a food is uncooked or improperly cooked.
12	Toxic substances naturally present in foods, which can be deactivated or neutralised during cooking.

## Heat transfer and cooking methods *(Match Up)*

1	Barbecuing – cooking food on a special grid, usually in an oven or over an open fire.
2	Cooking in a pan without the use of oil or fat.
3	Dry cooking method in which food is first sealed in fat and then stewed for a long time.
4	Dry cooking method that involves using an oven without exposing food to the flame.
5	Dry cooking method that uses a small amount of fat/oil to prevent foods from drying out.
6	Electromagnetic waves used in radars, radio transmissions or cooking, which quickly heat up water.
7	Fat-based cooking method in which food is sunk in a large amount of oil.
8	Fat-based cooking method that originated in Asia and that requires the use of a wok and a small amount of oil or sauce.
9	Fat-based cooking method which requires a small amount of fat to transfer the heat and seal the food.
10	Mixture of oil, acid, herbs and flavourings used to flavour and tenderise meat.
11	Moist cooking method in which food is kept below boiling point (85–99 degrees Celsius) for a long time.
12	Moist cooking method in which food is simmered below 85 degrees Celsius in a small amount of liquid in order to keep its texture.
13	Moist cooking method in which water vapour/steam is used to cook products that are placed above the liquid.
14	Moist cooking method where a large amount of bubbling water at 100 degrees Celsius is used.
15	Movement of thermal energy from one object to another, resulting in an increase in temperature.
16	Process in which heat is transferred directly to the food via vibration of the pan's molecules.
17	Process in which heat is transferred to food indirectly by sending heat waves to it.
18	Process in which heat is transferred to food indirectly through water or oil, or another medium.
19	The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
20	The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in taste or smell.
21	The process in which vegetables are put into boiling water for a short time and then quickly dipped into cold water.
22	Type of invisible radiation emitted by every living organism, used in grills and ovens to transfer heat to food.
23	When various preparation and cooking methods cause a decrease in the nutritional value of a food.

## ***Functional and chemical properties of proteins, fats and carbohydrates***

1	A solution of acid, oil, herbs and spices, used to prepare a range of meats and tenderise them.
2	Ability of fats to change their physical state at various temperatures, as well as to be easily spread and reshaped.
3	Branched polysaccharide – one of the compounds which build the chains of starch.
4	Denaturation of milk proteins in reaction to acid or enzymes, used in cheese production.
5	Light, delicate structure in which air bubbles are trapped in a liquid.
6	Long-chained carbohydrate present in potatoes, rice and pasta, built from amylose and amylopectin.
7	Molecule which is repelled by water molecules and doesn't mix easily with it.
8	One of the proteins present in flour, which, in presence of water, creates gluten.
9	One of the proteins present in flour, which, in the presence of water, creates gluten.
10	Popular emulsifier naturally occurring in egg yolk.
11	Process in which air bubbles are trapped in a mixture of fat, leading to cream formation.
12	Process in which fat molecules surround starch and prevent gluten formation, causing pastry to be flaky.
13	Process of mixing oil and water together to obtain a stable mixture, used to prepare mayonnaise.
14	Protein formed when flour is mixed with water, which builds a springy, elastic net and traps air to give the mixture its structure.
15	Reaction of starch to dry heating, in which long chains of starch break down into shorter ones, creating a slightly sweet flavour.
16	Reaction of starch to water and heating, in which starch granules swell and break up, used to thicken soups or cook a risotto.
17	Reaction of sugar to high temperatures, in which the sugar turns into syrup and changes its color and flavour.
18	Temperature at which fat transforms into oil.
19	The process of separating water from overcooked, overcoagulated proteins, e.g. in eggs.
20	Unbranched polysaccharide – one of the compounds which build the chains of starch.
21	What happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action?
22	What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.

## ***Functional and chemical properties of fruit, vegetables and raising agents***

1	Chemical element symbolised by Cu, used to make kitchen equipment and known for its high electrical conductivity, which may increase the rate of enzymatic browning in food.
2	Chemical element symbolised by Fe, used to make stainless steel cutlery and kitchen equipment, increase the rate of enzymatic browning in food.
3	Gas which is produced as the result of baking powder or yeast action in a food.
4	Mechanical action applied to batter in which air bubbles are trapped in the liquid.
5	Mechanical leavening method applied to fat and sugar mixtures, such as sponge, in which air but surrounded by fat.
6	Mechanical method of leavening in which air is trapped between layers of pastry.
7	Mechanical method of leavening in which air is trapped between particles of flour or icing sugar sponge cakes.
8	Mechanical method of leavening which uses a wiry metal or plastic tool.
9	Microscopic, single-celled fungus used as a raising agent due to its ability to produce carbon dioxide.
10	Mixture of sodium bicarbonate and calcium phosphate, used as a leavening agent.
11	Plain flour which has been enriched by the addition of baking powder or other chemical raising agents.
12	Process in which sugar is turned into alcohol and carbon dioxide, used in bread dough and wine.
13	Springy, soft cake made of eggs, sugar and flour, with or without the use of baking powder.
14	Substance necessary for yeast budding.
15	The action of gently massaging fat into flour to incorporate the air into the mixture and make it lighter.
16	The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
17	The effect on food of exposure to air, leading to decrease in nutritional value as well as a change in smell.
18	The process in which vegetables are put into boiling water for a short time and then quickly dipped in cold water.
19	Type of fatty pastry of many crumbly layers.
20	Vapour formed when water reaches its boiling point.
21	White powder used as a leavening agent in acidic foods, excess of which may cause a soapy flavour.

## Sensory properties *(Match Up)*

1	A test that aims to detail the appearance (sight), taste, and texture (feel) of food.
2	Actions taken to make sure all tasters have the same settings and instructions, in order to obtain results.
3	Cell located in the skin and other organs, specialised in conducting stimuli to the brain.
4	Desire to eat a specific food product, as opposed to hunger.
5	Features which make a food or a meal look good and appealing.
6	Group of sensory tests used to create a ranking, rating or profile of a given food.
7	Piece of bread or wafer that is neutral in taste and that is used during food tasting to serve spread.
8	Properties and aspects of food which are perceived via the senses, especially taste and smell.
9	Sensory test used to assess how much a property of food is liked or disliked, e.g. spiciness of various crisps.
10	Sensory test used to assess the strength of a given property in a range of food samples, e.g. sweet drink.
11	Specialised receptors localised on the tongue which are responsible for recognising flavours.
12	The combined sensation of taste, smell and mouthfeel.
13	The meaty, savoury taste.
14	The system used for recognising aromas.
15	The tissue which covers all of the inner organs, such as the digestive tract.
16	Type of sensory testing in which three samples, two of which are identical, are assessed at the same time.

## Conditions for bacteria, mould and yeast growth, and signs of food spoilage

1	All agents capable of causing diseases, such as bacteria, viruses or parasites.
2	Biologically active, protein-based compounds necessary for conducting many life processes, which act as catalysts in chemical reactions.
3	Effect of enzymatic action which leads to change in colour of a food.
4	Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
5	Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce under unfavourable conditions.
6	Heat treatment applied to vegetables and fruit to prevent browning.
7	High-temperature treatment of food or kitchen utensils in which all microorganisms and spores are killed.
8	Microscopic organisms found everywhere in the environment, on the human body and in food, which can cause food spoilage.
9	Microscopic organisms of various shapes used in food production, which can also cause disease.
10	Microscopic, single-celled fungus used in bread, wine and beer production.
11	Negative change in food properties caused by microorganisms and improper storage conditions.
12	Process conducted by bacteria or yeast in which sugar is turned into carbon dioxide and other products, such as alcohol and lactic acid.
13	Process of natural decomposition of fruit and vegetables.
14	Product of yeast fermentation used in wine and beer production.
15	Range of temperature which creates ideal conditions for bacterial growth and increases enzyme activity.
16	Reaction of the body to harmful microorganisms or toxins present in food.
17	Substance or agent which speeds up the rate of a chemical reaction.
18	The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in taste or smell.
19	Tiny fungi used in blue cheese production and which create a furry growth on bread and fruit, causing food to spoil.
20	Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
21	Type of bacteria which do not need oxygen to live.
22	Type of bacteria which need oxygen to live.
23	When bacteria spores become active again, leading to bacterial growth and food spoilage.

## ***Microorganisms in food production*** (Match Up)

1	Bacteria used in cheese production, added to begin the process of milk fermentation.
2	Coagulated milk – one of the steps of cheese production.
3	Enzyme used to coagulate milk in cheese production.
4	Harmless bacteria used in food manufacturing.
5	Invisible and odourless gas produced in sugar fermentation, which helps to obtain fizzy beverage dough to rise.
6	Milky liquid – a by-product of cheese production, drained from the cheese and used as a beverage feed.
7	One of the products of yeast fermentation, used in beer and wine production.
8	Process in which sugar is turned into another substance, used in yoghurt and cheese production.
9	Product of milk fermentation with the use of probiotic bacteria.
10	Single-celled fungus used as leavening agent in the manufacturing of bread.
11	Sugar which occurs naturally in milk.
12	Traditional British cheese made with the use of mould.
13	Traditional French cheese made with the use of mould, with a characteristic white skin.
14	What lactose is turned into during bacterial fermentation.

## Buying and storing food (Match Up)

1	A condition that occurs to frozen foods if they are not covered properly and air reaches them, causing oxidation and dehydration.
2	Amount of macro- and micronutrients present in a given food, ingredient or meal.
3	British government agency responsible for protecting public health in relation to food.
4	Date mark which applies to food quality, usually used for dry foods such as biscuits or pasta.
5	Date mark which applies to food safety, after which the food cannot be eaten any more; usually for unprocessed foods.
6	Defrosting – changing the physical state of food from solid and hard to soft or liquid, caused by a change in temperature.
7	Durability – the amount of time during which a food can be safely stored and eaten.
8	Endothermic process of changing the state of a food from solid to liquid or hard to soft by changing temperature it is stored at.
9	Foods which have a long shelf life and don't pose a risk of food poisoning.
10	Obligatory – necessary to include on a food label.
11	One of the mandatory elements of a food label, in which all the contents of the food are listed in order.
12	Range of temperatures at which the growth of microorganisms is the fastest, usually between 5 and 60 degrees Celsius.
13	Reduction in price.
14	Shop, supermarket or food seller which has a good reputation and can ensure the quality and safety of food on offer.
15	Statement on a food label indicating that consumption of a given food or an ingredient it contains is advantageous for health.
16	Statement on a food label indicating the presence of a given ingredient, usually added for health or nutritional value.
17	Storing food at temperatures below 0 degrees Celsius, in order to stop bacterial growth and preserve nutritional value.
18	Storing food at temperatures between 0 and 5 degrees Celsius, usually in a fridge or cooling cabinet.
19	Temperature of the air surrounding us, usually considered to be between 20 and 25 degrees Celsius; dry, sealed food can be safely stored.
20	The origin of food – place where the food comes from.
21	When a strong smell from one food goes into another, less strongly smelling, food product.

PROTECTED**

## Preparing and cooking food (Match Up)

1	All the actions and procedures taken to ensure that food is not harmful and is secure to eat.
2	Bacteria species naturally occurring in the human intestines but which is harmful if eaten.
3	Bacterium commonly found on the skin, which produces toxins and causes food poisoning when
4	Electronic tool used to measure the temperature inside food.
5	Food products which offer the best conditions for microorganism growth and increase the risk of poisoning or food allergy.
6	Food products which offer the best conditions for microorganism growth and increase the risk of poisoning, which include raw, moist, protein-rich and ready-to-eat products.
7	Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce in friendly conditions.
8	Habits and actions taken by individuals in order to prevent food contamination or poisoning.
9	Harmful bacteria that cause diseases and poisoning.
10	Harmful substance released by microorganisms and other organisms, usually bitter in taste, which causes poisoning.
11	Item of clothing used to prevent hair from falling into food.
12	Item of clothing used to protect the cook's clothes and body from dirt, stains or damage caused by splattering.
13	One of the most common reasons for food poisoning, found in unpasteurised milk.
14	Perishable food product usually associated with food poisoning – the only one which should not be eaten after the best before date.
15	Process in which microorganisms are killed, usually with the use of high temperatures or antibiotics.
16	State in which microorganisms' bodily functions are slowed down and all activity is minimised in order to survive unfriendly conditions such as low temperatures and allow for later growth.
17	Substances or ingredients present in a food which may pose a possible danger to someone who is allergic or susceptible to them.
18	The most common cause of food poisoning in the UK, found in offal and poultry.
19	The most common cause of hospital admissions from food poisoning in the UK, typically associated with undercooked eggs.
20	The number of degrees Celsius or Fahrenheit in the centre of a cooked food product.
21	Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
22	When a poisonous agent, pathogen or food particle is transferred from one food to another by touching, having contact with dripping, etc.
23	When a poisonous agent, pathogen or food particle is transferred to a food via polluted hands, tools or other carriers.

## Balanced diet and guidelines (Table Fill)

State in which excessive amounts of macro- or micromolecules are provided, which may lead to many diet-related health conditions.
State in which insufficient macro- and micronutrients are provided, often leading to weight loss and diseases caused by nutrient deficiency.
Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients.
Ratio of body mass to height squared ( $\text{kg/m}^2$ ), used to assess whether someone's weight is optimal for their height.
Sugars added to food products, as opposed to those naturally occurring in foods, consumption of which should be limited to remain healthy.
Sugars naturally occurring in food products, as opposed to free sugars.
Habits and behaviours which include little or no physical activity.
Movement of the body which requires energy expenditure.
Diet which provides the correct quantity and quality of macro- and micronutrients to support health and well-being.
Dietary guideline in the shape of a plate which indicates five categories of food product and how much of each of them should we eat.
Dietary guideline which recommends eating around 400 g of vegetables and fruit a day, divided into five portions.
Simple sugar which is a basic source of energy for all of the cells around the human body.

## Major diet-related health issues (Table Fill)

Chronic disease caused by insufficient performance of insulin, in which abnormally high blood sugar levels occur.
Condition in which heart blood vessels are narrowed by the accumulation of cholesterol plaque, which may lead to heart attack.
Mammary gland tumour, for which risk factors include obesity, drinking alcohol and lack of exercise, as well as hormonal issues and gene mutations.
Tumour of the lower digestive tract, for which risk factors include low consumption of dietary fibre, obesity and unhealthy diet.
Condition in which crystals accumulate in joints, causing swelling, pain and difficulty walking, often as an effect of unhealthy diet and obesity.
State in which blood is not provided to the brain or massive bleeding occurs in the brain, causing damage or death to the brain cells.
Abnormally high blood pressure, characteristic of cardiovascular diseases.
Condition in which bones lose their density and become fragile and easy to break.
Condition in which enamel is damaged by bacteria.
Condition caused by iron deficiency or an inability to properly ingest it.
The body's defence system, protecting it from infections and fighting off bacteria and viruses.
State in which insufficient amounts of macro- and micronutrients are provided.
Condition in which veins and arteries are narrowed due to cholesterol plaque accumulation.
The blood vessels which pump blood to the heart.
Important hormone, produced in the pancreas, which is responsible for lowering blood sugar levels.
Important organ which produces enzymes which are necessary for proper digestion and hormones which regulate blood sugar levels.
Inflammation of the pouches within the large intestine, which causes painful symptoms and requires a low-fibre diet to minimise them.

# Nutritional and dietary needs of different groups of

Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts to allow proper functioning of the human body.
Disease characterised by immune reaction to gluten, leading to damage of the villi in the intestines and nutrient malabsorption.
Condition (usually acquired) in which milk sugar cannot be digested properly, causing bloating, stomach ache and diarrhoea.
State in which insufficient amounts of macro- and micronutrients are provided.
Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
Chemical substances necessary for building the body and providing energy, needed in large amounts.
Amount of food eaten in one meal, usually differing depending on a person's age, sex and body size.
Consumption of this type of sugar should be limited to less than 5% of daily calorie intake.
Essential fatty acids, present in large amounts in fish, with double bonds located at the third carbon atom from the end of the fatty acid chain.
Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and lowering the risk of bowel cancer.
Process of supplying a sufficient level of water in the body.
Amount of disposable income which a family can spend on different goods, e.g. food or entertainment.
Children's ability to pressurise their parents into buying them sweets, toys or other items.
Period in which the body grows rapidly, i.e. in early childhood and during adolescence.
The maximum bone density, reached during adolescence and early adulthood, thanks to calcium accumulation.
Natural process in a female body which increases the need for iron, as otherwise anaemia may occur.
Condition caused by iron deficiency or inability to properly ingest it.
Food which provides many calories in one meal.
Protein which is found in some cereals, such as wheat, rye or barley, and which cannot be eaten by people with coeliac disease.
Glycaemia, or the amount of glucose present in the blood.
Process and period of time during which mammary glands produce milk to feed a baby.
Inorganic substance produced by the fermentation of sugars that is damaging to the health if too much is drunk.

Nutritional needs when selecting recipes for different people

(Table Fill)

Table which shows detailed nutritional information about food products and ingredients.	
Amount of macro- and micronutrients present in a given food, ingredient or meal.	
Chemical substances necessary for building the body and providing energy, needed in large amounts.	
Chemical substances necessary for the proper functioning of the body, needed in small amounts only.	
State in which sufficient, appropriate amounts of nutrients and water are provided.	
Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts from various sources.	
Type of notes or record in which all foods eaten during a certain period of time are written in order to assess one's diet or eating habits.	
Digestible polysaccharide present in rice, bread or pasta, built from long chains of glucose particles joined together.	
Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and lowering the risk of bowel cancer.	
Amount of food eaten in one meal, usually differing depending on a person's age, sex and body size.	
Type of fats in which all the chemical bonds are single, present in large amounts in lard or butter.	
Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.

## Energy balance (Table Fill)

Unit used to measure energy, which equals approximately 4,184 joules.
Food which provides many calories in one gram.
Easily available source of energy which is used as a first resort.
Source of energy which is used only if other resources are unavailable.
Amount of energy necessary for conducting basic life functions, such as breathing or heartbeat.
Indicator of the amount of energy needed to perform all life activities, such as walking, running, sleeping, showering, etc.
Food rich in certain macromolecules, such as carbohydrates or fats, which is consumed mainly to provide power.
Unit used to measure energy, equal to 0.24 kilocalories.
Triglycerides – dense macromolecules present in a range of foods, which should provide up to 35% of daily calorie intake.
Group of macronutrients which should provide around 50% of daily energy intake, usually along with group B vitamins and dietary fibre.
Group of macronutrients which should constitute around 15% of daily calorie intake.
Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients.
What happens to the body when the energy balance is negative – more energy is burnt than is provided in the diet.
Situation in which energy consumption and expenditure are equal.
The way in which a person lives and how active a person is, which significantly affects energy needs.

## Protein (macronutrients) (Table Fill)

Long chains of amino acids that are the building blocks of the body, support growth and development, and make up 15% of a balanced diet.
Type of protein in which some of the essential amino acids are in low amounts or lacking; usually of plant origin.
Type of protein in which all essential amino acids are present in the correct amounts; usually of animal origin.
A process that happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
Combining two or more low biological value proteins in a meal to produce a high biological value meal.
Protein-rich products made without the use of animal-derived ingredients.
Protein-rich product made by <i>Fusarium venenatum</i> fungi.
What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.
Nitrogen-based molecules that bind together to form a chain of peptides.
Amino acids which cannot be produced by the human body from scratch and have to be provided as a part of a healthy diet.
Amino acids which can be built by the human body from available resources.
Type of bean rich in high biological value protein, used for manufacturing many other products, such as flour, oil, sauce or cheese-like products.
Tiny, easy-to-digest, gluten-free grains originating from South America, rich in carbohydrates, protein and fibre, and used as a protein alternative.
Condition caused by prolonged deficiency of protein, occurring especially in developing countries and characterised by swelling of the stomach.
A by-product of extracting oil from soya beans, usually in the form of chunks.
Protein alternative made from coagulated soya milk pressed together into soft blocks, characteristic of Asian cuisine and also known as bean curd.
Traditional Japanese paste made of fermented soya, used for sauces and spreads.

INSPECTION COPY

## Fat (macronutrients) (Table Fill)

An energy-dense macromolecule built from glycerol and three chains of acids, necessary for building hormones and insulating the body.
Type of fat in which all the chemical bonds are single.
Type of fat in which one or more double chemical bonds are present.
Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients.
Type of fat where more than one double chemical bond is present in the fatty acid chain.
Type of fat where only one double chemical bond is present in the fatty acid chain.
Type of fats which are produced as a result of heating oils to high temperatures for a long time.
Connective tissue whose main function is to store energy, and insulate and cushion organs.
A mixture of oil and water.
A fat which is naturally present in foods and which cannot be seen before extraction.
A fat which is naturally present in foods and which can be seen in the form of fatty tissue or oil.
Visible fat surrounding the loins and kidneys of cows and sheep, high in saturated fats and characteristic of traditional British cuisine.
The only animal-derived fat which is liquid at room temperature.
The chemical name for a fat molecule.
Three long hydrocarbon chains attached to a glycerol particle to form a molecule of fat.
Fatty substance necessary for building cell membranes and bile in the gall bladder.
Low-density fraction of cholesterol which transports fat around the body and to the cells.
High-density fraction of cholesterol which transports fats from the blood to the liver, and lowers blood cholesterol levels.
Fatty acids which cannot be built by the human body from scratch and have to be provided as a part of a healthy diet.
Group of chemical substances which include fatty acids, triglycerides, waxes and sterols, and which are insoluble in water.
Chronic disease characterised by high blood sugar levels, often developing as a result of high fat intake and obesity.
One of the first signs of fat deficiency in a diet, which sees a decrease in body weight.

INSPECTION COPY

PROTECTED**

## Carbohydrate (macronutrients) (Table Fill)

Large organic macromolecules produced by plants during photosynthesis, and which include sugars, starch and fibre.
Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.
Organic macromolecules produced by plants, bound into long chains in order to store energy for later.
Substance occurring in plant cells only, usually indigestible for humans but necessary for maintaining health.
Carbohydrates built from one molecule only.
Carbohydrate which is built from large number of molecules bound together into long chains.
Simple sugar which is a basic source of energy for all of the cells around the human body.
Disaccharide present in milk.
Sugars added to food products, as opposed to those naturally occurring in foods.
Polysaccharide stored in the liver and muscle cells which is an emergency source of energy.
Type of fibre which absorbs water and enhances bowel movements, usually in the form of cellulose or lignin.
Type of fibre which swells in the stomach giving the feeling of satiety, usually in the form of pectin or gum.
Carbohydrates built from two particles of sugars, examples of which are lactose and sucrose.
Commonly used sweet substance built from one molecule of glucose and one molecule of fructose, obtained from sugar beet and sugar cane.
Disaccharide built from two molecules of glucose, obtained from germinating grains.
Monosaccharide which, together with glucose, forms a molecule of milk sugar.
A simple sugar built from five atoms of carbon, naturally occurring in fruit.
Flour made from whole grains, without separating the bran.
Type of soluble fibre present in fruit, which acts as a gelling agent.
Condition in which enamel is damaged by bacteria, causing pain and trouble eating.
Sugars that occur naturally in food products, as opposed to free sugars.
One of the first noticeable signs of carbohydrate deficiency in a diet, seeing a decrease in body weight.

INSPECTION COPY

COPYRIGHT  
PROTECTED

## Vitamins (micronutrients) (Table Fill)

Organic molecules needed in very small amounts, usually provided by the diet but some can also be produced in the body.
Chemical substance or molecule which has the ability to stop and prevent the damage caused by free radicals.
Form of vitamin A found in animal-derived foods.
Form of vitamin A found in fruit and vegetables.
Eyesight condition caused by vitamin A deficiency.
Childhood disease caused by an imbalanced, micronutrient deficient diet.
Condition in which bones lose their density and become fragile and easy to break.
Bacteria living in the gut, where they aid digestion and produce vitamins, e.g. vitamin K.
A pill or capsule taken to top up micronutrient levels in the body and improve overall health.
The chemical name for vitamin B1, deficiency of which causes beriberi disease.
The chemical name for a water-soluble vitamin which is crucial for releasing energy from foods (vitamin B2).
The chemical name for vitamin B3, necessary for releasing energy from food, found in lean meat, eggs and milk.
The chemical name for vitamin B9, crucial for proper development of the spinal cord and for the production of red blood cells.
Condition caused by folate deficiency during the prenatal period.
Disease caused by thiamine deficiency, symptoms of which include weakening of the muscles leading to paralysis.
Type of anaemia caused by vitamin B12 deficiency, as opposed to iron deficiency anaemia.
Disease caused by vitamin C deficiency, the main symptoms of which include receding and bleeding gums, and tooth loss.
The chemical name for vitamin E, found in vegetable oils and oily fish.
Disease caused by niacin deficiency, characterised by sensitivity to sunlight.
Atoms or particles which lack electrons and steal them from other particles, causing damage and oxidative stress.
The chemical name for vitamin B12, found mainly in meat, offal and egg yolk.
The chemical name for vitamin C, found mainly in fruit and vegetables, such as potatoes, blueberries or cabbage.
The chemical name for vitamin D, present in large amounts in milk, dairy products and oily fish, and also produced in the skin.

INSPECTION COPY

## Minerals and water (micronutrients) (Table Fill)

Condition in adults in which bones lose their density and become fragile and easy to break.
Condition caused by improper fluoride intake and bad mouth hygiene, where enamel becomes damaged by acids and bacteria.
The hardest tissue in the human body, which forms the external part of the teeth.
Products made from milk, often high in calcium.
Condition caused by a deficiency of micronutrients, in particular iron, vitamin B12 and folate, characterised by low red blood cell levels.
Abnormally high blood pressure, usually caused by excessive sodium intake, narrowing of the blood vessels or certain hormones.
Process in which drinking water is enriched in fluoride.
Small gland in front of the neck which produces hormones necessary for proper metabolism.
Condition caused by iodine deficiency, symptoms of which include swelling of the neck and changes in metabolism.
Red pigment in blood cells, built from four peptide chains attached to iron atoms, responsible for transporting oxygen in the body.
Invertebrate marine organisms used as food which is rich in protein and iodine.
State caused by excessive loss and insufficient replenishment of water, usually as the result of excessive sweating or exaggerated physical activity.
Serious condition in which the body cannot cool down any more and gets so hot that it becomes dangerous, e.g. as the result of very hot weather.
Liquid, salty secretion from glands located mainly in the armpits and from skin pores all over the body.
Condition caused by hyperhydration, in which electrolytes in the blood become too diluted, resulting in fatal swelling of the brain.
Function of water whereby harmful substances are removed from the body.
Chemical element found in milk, dairy products and bony fish, necessary for the proper development and growth of bones and teeth.
Element necessary for building red blood cells, which is easily ingested from meat and eggs but which is harder to ingest from plant-derived foods.
An electrolyte – an element necessary for proper conducting electrical impulses and regulating blood pressure.
Chemical trace element necessary for the proper development of tooth enamel.
Trace element necessary for building thyroid hormones which regulate the rate of metabolism in the body.
One of the elements necessary for the proper mineralisation of bones, but also needed to release energy and build DNA.
Inorganic chemical element necessary for the body to build cells, conduct electric impulses or build hormones.

PROTECTED**

## Food source and supply (Table Fill)

The origin of food – place where the food comes from and how is it manufactured.
Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
Chemical, nutrient-rich mixture used to enrich and improve soil quality in order to obtain higher crop yield.
Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable features.
Food product produced without the use of any artificial colours, pesticides, antibiotics or GM feeds or fertilisers.
Bringing or transporting goods from another country.
Long, transparent plastic used in farming in order to provide warmth to plants and protect them from unfavourable weather conditions.
Plant growing method in which roots are placed into water instead of soil, used to grow lettuces or radishes.
Food product which is eaten in large quantities and forms the basis of a regional or national diet, usually due to climate and weather conditions allowing the growth and rearing of certain food products only.
Method of egg production in which hens can move freely outside the barn; eggs from such hens are labelled 1.
Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
The idea which advocates humane conditions and treatment for animals.
Spiral molecule locked in the nucleus of a cell, which carries all the information about a person, animal or plant.
Part of a DNA molecule which carries specific information, such as the colour of a flower or size of a fruit.
Foods such as mushrooms, herbs, roots and wild fruit which are not farmed but are looked for in the wild.
Food characteristic of a given time of year.
The meat of a deer.
Activity during which people catch and kill wild animals and birds, often with the use of specially trained dogs.
Foods made from animals which were purposely bred in a farm in order to obtain milk, egg, meat or other benefits.
All animals reared on a farm for meat or other purposes.
The meat of domesticated birds, such as chicken, goose, turkey and duck.
The meat of caught animals, such as pheasant, wild boar or rabbit.

## Food processing and production part 1 (Table Fill)

Various bacteria species which are beneficial for health and useful in food production.
Furry microorganism which is used in blue cheese production and which causes bread and fruit spoilage.
Milky liquid, a by-product of cheese production, drained from the cheese and used as a beverage or animal feed.
Coagulated milk – one of the steps of cheese production.
Processes which affect food's properties or turn it into a different product.
Raw, unrefined food, usually freshly harvested.
Early processes in which food is turned from raw produce into ingredients for an edible, saleable food product.
Transparent, tasteless substance derived from collagen, used as a gelling agent.
Live bacteria added to pasteurised milk to begin the process of fermentation during cheesemaking.
A type of fibre which occurs naturally in fruit and which acts as a gelling agent.
Disaccharide which occurs naturally in milk and which is transformed into acid during milk fermentation.
Acid produced from milk sugar during fermentation of milk.
Net-like protein in wheat, rye and barley, responsible for the soft, springy texture of bread.

**Food processing and production part 2** (Table Fill)

Gathering the crops from a field or orchard.
Pulverising – turning grain into powder.
Process of gently heating a liquid or a food product to 72°C in order to kill harmful bacteria and make food safe to eat.
Heat treatment of milk and meat preserves in which the food is heated to 130°C for 30 minutes to kill all bacteria and spores and significantly increase the shelf life of the finished product.
Pressing milk through very fine membranes in order to remove bacteria.
Turning milk into yoghurt or cheese with the use of bacteria.
Freezing food and removing moisture afterwards under pressure to enhance shelf life without affecting nutritional value of a food.
Important step in production of cheese, in which it is either immersed in or coated with brine in order to improve its taste and lengthen its shelf life.
Process of decreasing the amount of fat in milk.
Process of decreasing the size of fat particles in milk by pressing them through tiny holes to obtain a stable mixture.
Process of turning milk or cream into butter.
Dairy product made of the fat layer skimmed off the top of milk before homogenisation.
Preserving method in which cooked food is quickly chilled from 70 to 3 degrees Celsius to prevent bacterial growth and make it safe to eat.
Storing and packaging food in conditions where oxygen, nitrogen and CO <sub>2</sub> concentrations, air humidity and temperature are carefully regulated.
Storing and packaging food in conditions where the composition of air is modified to improve the food's shelf life and prevent oxidation.

Food security part 1 (Table Fill)

Process of turning a used product (e.g. newspaper) into a new one (e.g. toilet paper).
Invisible, odourless gas produced in large amounts during food production and transportation, capable of trapping warmth around the Earth.
CO <sub>2</sub> , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap warmth around the Earth and contribute to global warming.
Synthetic, usually elastic compound which is very hard to decompose and which is used to produce food packaging.
Light, white synthetic material which does not decompose easily which is used to insulate and protect goods.
Amount of CO <sub>2</sub> released during the production and transportation of a given good, e.g. a food product.
The distance a food item has to travel from a farm to the plate of a consumer.
Foods characteristic of a given time of year.
Food assurance scheme which ensures food safety, traceability, environmental protection and animal welfare in the UK.
Ability to produce sufficient amounts of food, ensuring that the ecosystem remains stable and diverse.
Food product produced without the use of any artificial compounds, pesticides, antibiotics or GM feeds or fertilisers.
Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
Naturally occurring, usually non-renewable reserves of non-organic or organic matter, such as water, coal or wood.
Situation in which the average temperature on Earth rises, causing weather anomalies and melting of glaciers.
Able to be broken down in natural conditions, e.g. by bacteria and pests.
All food which has not been eaten for various reasons, and has to be disposed of due to spoilage, an exceeded date mark or another reason.

## Food security part 2 (Table Fill)

State in which everybody around the world has a sufficient amount of safe, healthy, nutritious food.
Bringing or transporting goods from another country.
Poor, unindustrialised countries which are attempting to increase their growth rate and quality of life by trading and implementing modern technologies.
State in which a person does not provide sufficient amounts of macro- and micronutrients, often leading to deficiency-related diseases.
Situation in which the average temperature on Earth rises, causing weather anomalies and melting of glaciers.
CO <sub>2</sub> , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap warmth around the Earth and contribute to global warming.
Ethical way of trading between developed and developing countries, which allows fair prices and wages for the farmers and farm workers.
State in which no rainfall has occurred for a prolonged period of time, causing crop failure and major problems with food production or hygiene.
State in which massive rainfall has occurred for a prolonged period of time, causing rivers to leave their beds and swamp the surrounding land.
Ice or snow mass formed at the tops of mountains and near the poles.
Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable features.
Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
Amount of CO <sub>2</sub> released during the production and transportation of a given good, e.g. a food product.
The distance a food has to travel from a farm to the plate of a consumer.
Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
Chemical substances used to enrich and improve soil quality in order to obtain higher crop yields.
Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
Variety of species living in the environment.
Place where fish are caught or reared, either in the wild or in fish farms.
State in which too many fish are caught, leading to the extinction of a given shoal or the extinction of the species.
Accidentally catching fish or other animals which weren't intended to be caught.

# Technological developments to support better health

(Table Fill)

Addition of nutrients to a given product to improve or restore its nutritional value.
Obligatory – necessary to add to a food product by law.
Kind of flour which does not have to be fortified because its nutritional value has not been affected by processing.
Kind of milk which has to be fortified by law due to its low fat content.
Soft, spreadable mixture made of hydrogenated vegetable oils, used instead of butter, and fortified in vitamins A and D by law.
A vitamin added to plain flour by law to restore levels lost during milling, the deficiency of which may cause beriberi.
A vitamin added to plain flour by law to reduce the risk of pellagra and other effects of its deficiency.
A mineral added to plain flour by law to prevent anaemia.
A mineral added to plain flour by law to prevent rickets and osteoporosis.
Substance added to fat spreads and skimmed milk by law.
Pigment – agent used to change or enhance the visual aspects of food.
Substance used to improve the texture of food and prevent separation of ingredients.
Agent used to change or enhance the taste and smell of food.
Natural or synthetic substance used to replace sugar and decrease the calorific value of a food.
Natural or synthetic agent used to enhance the shelf life of a food and prevent spoilage.
Fatty substance which does not occur in vegetable fats, responsible for many diet-related conditions.
Naturally occurring molecules found in plant substances which have the potential to lower blood cholesterol level and decrease the risk of heart failure.
Additive used to maintain a food's chemical structure
Chemical substances containing nitrogen used in the production of cured meats to prevent the growth of <i>Clostridium botulinum</i> bacteria and improve the colour of the final product.
Microorganism (usually bacteria species) which provide health benefits if consumed, present in, e.g. yoghurt or pickled cabbage.
Plant fibre or another substance which promotes the growth of probiotic bacteria, e.g. inulin found in onion.
Chemical substances, e.g. vitamin C, added to food products to enhance their shelf life by preventing oxygen activity.
Substance such as modified starch used to increase the viscosity of a product.

Development of culinary traditions (Table Fill)

Style of cooking characteristic of a country or region, which uses specific ingredients and cooking methods.
Britain's most popular traditional hard cheese, made from cow's milk and originating from Somerset.
Small snacks or biscuits eaten before noon.
Traditional British meal consisting of sandwiches, cakes or scones and a pot of tea.
Afternoon nap or rest typical of southern countries such as Spain or Mexico.
Originating from Italy, a small snack eaten before the main dish to increase the appetite.
Traditional Spanish dish made of rice, vegetables, chicken and seafood, usually served in a shallow frying pan.
Deep frying pan characteristic of Asia.
Cutlery items used instead of a knife and fork in East Asia.
Round clay oven used for cooking traditional Indian meals.
A pizza that is folded before cooking.
Traditional Japanese dish made of rice, seaweed and fish or vegetables, dipped in soy sauce or wasabi paste.
Traditional Scottish dish made from offal, oats and herbs sealed in an animal's stomach.
Style of cooking characteristic of the south of Europe.
Clay dish with a lid used for prepare traditional Arab meals.
Food product which constitutes the basis of a daily diet in a region or country.
Cuisine which is formed from many different ethnic groups, increasing the variety and diversity of ingredients and cooking methods.
Traditional dessert characteristic of Greece and Turkey, made from flaky pastry with a filling traditionally made from nuts, and soaked in milk or honey.

## Personal, social, economical and medical reasons

Indicator of the amount of energy needed to perform all life activities, such as walking, running, sleeping and showering.
Unusual or particularly important event; cause for celebration and enjoyment, during which festive foods and drinks are consumed.
The cost of food – the amount of money one has to pay to buy the food.
Situation in which food is present in the market and affordable for the buyers, thanks to modern farming methods, storage system improvements and imports.
Habits and actions of an individual – the way a person lives.
Describes food that is characteristic of a given time or year.
Person who buys and eats foods – the consumer.
The negative reaction of the digestive system to a food ingredient, often manifesting as stomach cramps or diarrhoea.
The reaction of the immune system to a food ingredient, which may lead to anaphylactic shock.
The sugar naturally present in milk and one of the most common causes of food intolerance.
A protein present in wheat, rye and barley, and which is a cause of food intolerance.
The enzyme which breaks down milk sugar in the small intestine.
Disease in which gluten cannot be digested and a gluten-free diet has to be followed for the person's entire life.
Process of developing international and intercontinental relations, trade and cultural exchange, which can improve food availability and affect food choices of people even in very remote countries.
Severe, life-threatening allergic reaction to food or other factors.

## Religious, cultural, ethical and moral beliefs (Table Fill)

Type of diet which does not allow consumption of meat, and sometimes other animal-derived foods such as fish, milk or eggs.
Type of diet which does not allow consumption of any animal-derived food products.
All actions, traditions, ideas or beliefs characteristic of a country, region or ethnic group.
The meat derived from a commonly reared animal, forbidden in many religions, such as Islam or Judaism.
Chemical substance occurring in beverages, forbidden in many religions.
The idea/movement which defines dietary restrictions for Rastafarians.
Foods and other goods which are permissible for Muslims.
Foods and other goods which are permissible for Jews.
Hindu festival of lights, celebrated in autumn.
In Islam, a month-long fasting period during which nothing can be eaten or drunk from sunrise to dusk.
Person who is worshipped and whose teachings are followed, e.g. in Sikhism.
The principle of humane treatment and conditions for animals.
Ethical way of trading between developed and developing countries, which allows fair prices and wages for the farmers and farm workers.
Food product produced without the use of any artificial compounds, pesticides, antibiotics, GM feeds or fertilisers.
Farming method which aims at minimising the costs and increasing the yield by the use of modern technologies, pesticides, artificial fertilisers, etc.
Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable features.
Variant of vegetarianism which allows the consumption of eggs and dairy products.
Variant of vegetarianism which allows the consumption of dairy products.
Variant of vegetarianism which allows the consumption of eggs.

**Reasons why food is cooked** (Table Fill)

All actions and procedures taken to ensure that food is not harmful and is secure to eat.
The combined sensation of taste, smell and mouthfeel, which can be greatly altered and improved during cooking.
The consistency of a food product, usually created or altered during cooking.
The smell of food, usually more prominent in hot foods than in cold ones.
Term that refers to whether food is pleasurable and agreeable to the palate.
Food which is in its natural state, before any heat treatment or processing.
Durability – the amount of time during which a food can be safely stored and eaten.
Toxic substances naturally present in foods, which can be deactivated or neutralised during cooking.
Appealing – stimulating craving for a particular food product.
Tiny, omnipresent microorganisms which can cause food poisoning if a food is uncooked or improperly cooked.
Process of softening and improving the texture of meat and poultry by slow-cooking, cutting it into pieces, or using a marinade or a mallet.
Process of breaking down nutrients in the stomach and intestines into a form which can be ingested through the gut wall into the bloodstream.

INSPECTION COPY

## Heat transfer and cooking methods (Table Fill)

Movement of thermal energy from one object to another, resulting in an increase in temperature.
Process in which heat is transferred directly to the food via vibration of the pan's molecules.
Process in which heat is transferred to food indirectly through water or oil, or another medium, such as air.
Process in which heat is transferred to food indirectly by sending heat waves to it.
Electromagnetic waves used in radars, radio transmissions or cooking, which quickly heat up water particles.
Type of invisible radiation emitted by every living organism, used in grills and ovens to transfer heat to the food.
Moist cooking method in which food is cooked in steam. Steam is used to cook products that are placed above boiling water.
The process in which vegetables are put into boiling water for a short time and then quickly dipped into ice-cold water.
Moist cooking method in which food is simmered below 85 degrees Celsius in a small amount of liquid in order to keep its texture.
Dry cooking method in which food is first sealed in fat and then stewed for a long time.
Fat-based cooking method that originated in Asia and that requires the use of a wok and a small amount of oil or sauce.
Mixture of oil, acid, herbs and flavourings used to flavour and tenderise meat.
When various preparation and cooking methods cause a decrease in the nutritional value of a food product.
The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in flavour or smell.
Moist cooking method where a large amount of bubbling water at 100 degrees Celsius is used.
Moist cooking method in which food is kept below boiling point (85–99 degrees Celsius) for a long time.
Dry cooking method that involves using an oven without exposing food to the flame.
Dry cooking method that uses a small amount of fat/oil to prevent foods from drying out.
Barbecuing – cooking food on a special grid, usually in an oven or over an open fire.
Fat-based cooking method which requires a small amount of fat to transfer the heat and seal the surface of a food.
Fat-based cooking method in which food is sunk in a large amount of oil.
Cooking in a pan without the use of oil or fat.

# Functional and chemical properties of proteins, fats

(Table Fill)

What happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.
Protein formed when flour is mixed with water, which builds a springy, elastic net and traps air bubbles within the mixture.
Light, delicate structure in which air bubbles are trapped in a liquid.
A solution of acid, oil, herbs and spices, used to prepare a range of meats and tenderise them.
Denaturation of milk proteins in reaction to milk curdling enzymes, used in cheese production.
The process of separating curd from overcooked, overcoagulated proteins, e.g. in eggs.
One of the proteins present in flour, which, in the presence of water, creates gluten.
One of the proteins present in flour, which, in presence of water, creates gluten.
Reaction of starch to water and heating, in which starch granules swell and break up, used to thicken sauces or cook a risotto.
Reaction of starch to dry heating, in which long chains of starch break down into shorter ones, creating a slight sweet flavour.
Reaction of sugar to high temperatures, in which the sugar turns into syrup and changes its colour and flavour.
Unbranched polysaccharide – one of the compounds which build the chains of starch.
Branched polysaccharide – one of the compounds which build the chains of starch.
Long-chained carbohydrate present in potatoes, rice and pasta, built from amylose and amylopectin.
Process in which fat molecules surround starch and prevent gluten formation, causing pastry to be crumbly.
Process in which air bubbles are trapped in a mixture of fat, leading to cream formation.
Ability of fats to change their physical state at various temperatures, as well as to be easily spread or seeped.
Process of mixing oil and water together to obtain a stable mixture, used to prepare mayonnaise.
Temperature at which fat transforms into oil.
Molecule which is repelled by water molecules and doesn't mix easily with it.
Popular emulsifier naturally occurring in egg yolk.

INSPECTION COPY

# Functional and chemical properties of fruit, vegetable

(Table Fill)

The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
The effect on food of exposure to air, leading to decrease in nutritional value as well as a change in flavour or smell.
Chemical element symbolised by Fe, used to make stainless steel cutlery and kitchen equipment, which may increase the rate of enzymatic browning in food.
Chemical element symbolised by Cu, used to make kitchen equipment and known for its high electric and thermal conductivity, which may increase the rate of enzymatic browning in food.
The process in which vegetables are put into boiling water for a short time and then quickly dipped into ice-cold water.
Mixture of sodium carbonate and calcium phosphate, used as a leavening agent.
White powder used as a leavening agent in acidic foods, excess of which may cause a soapy flavour.
Gas which is produced as the result of baking powder or yeast action in a food.
Vapour formed when water reaches its boiling point.
Plain flour which has been enriched by the addition of baking powder or other chemical raising agents.
Mechanical method of leavening which uses a wiry metal or plastic tool.
Mechanical method of leavening in which air is trapped between layers of pastry.
Mechanical method of leavening in which air is trapped between particles of flour or icing sugar, used to make sponge cakes.
Springy, soft cake made of eggs, sugar and flour, with or without the use of baking powder.
Type of fatty pastry of many crumbly layers.
Microscopic, single-celled fungus used as a raising agent due to its ability to produce carbon dioxide.
Process in which sugar is turned into alcohol and carbon dioxide, used in bread dough and wine production.
Substance necessary for the setting of dough.
Mechanical action applied to batter in which air bubbles are trapped in the liquid.
Mechanical leavening method applied to fat and sugar mixtures, such as sponge, in which air bubbles are surrounded by fat.
The action of gently massaging fat into flour to incorporate the air into the mixture and make it lighter.

## Sensory properties (Table Fill)

Cell located in the skin and other organs, specialised in conducting stimuli to the brain.
Properties and aspects of food which are perceived via the senses, especially taste and smell.
Specialised receptors localised on the tongue which are responsible for recognising flavours.
The meaty, savoury taste.
The system used for recognising aromas.
The tissue which covers all of the inner organs, such as the digestive tract.
The combined sensation of taste, smell and mouthfeel.
Actions taken to ensure that all tasters have the same settings and instructions, in order to obtain reliable results.
Sensory test used to assess the strength of a given property in a range of food samples, e.g. sweetness of a drink.
Sensory test used to assess how much a property of food is liked or disliked, e.g. spiciness of various brands of crisps.
Piece of bread or wafer that is neutral in taste and that is used during food tasting to serve spreads and pastes.
Desire to eat a specific food product, as opposed to hunger.
Group of sensory tests used to create a ranking, rating or profile of a given food.
Features which make a food or a meal look good and appealing.
Type of sensory testing in which three samples, two of which are identical, are assessed at the same time.
A test that aims to detail the appearance (sight), taste, and texture (feel) of food.

# Conditions for bacteria, mould and yeast growth, and food spoilage (Table Fill)

Negative change in food properties caused by microorganisms and improper storage conditions.
Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
Tiny fungi used in blue cheese production and which create a furry growth on bread and fruit, causing the food to spoil.
Microscopic organisms of various shapes used in food production, which can also cause diseases and food poisoning.
Microscopic, single-celled fungus used in bread, wine and beer production.
Biologically active, protein-based compounds necessary for conducting many life processes, which also act as catalysts in chemical reactions.
Microscopic organisms found everywhere in the environment, on the human body and in food, which can cause food spoilage.
Process conducted by bacteria or yeast in which sugar is turned into carbon dioxide and other substances, such as alcohol and lactic acid.
Product of yeast fermentation used in wine and beer production.
Type of bacteria which need oxygen to live.
Type of bacteria which do not need oxygen to live.
All agents capable of causing diseases, such as bacteria, viruses or parasites.
Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
Substance or agent which speeds up the rate of a chemical reaction.
Reaction of the body to harmful microorganisms or toxins present in food.
Range of temperature which creates ideal conditions for bacterial growth and increases enzyme activity.
Effect of enzymatic action which leads to change in colour of a food.
Heat treatment applied to vegetables and fruit to prevent browning.
The effect on food exposed to air, leading to a decrease in nutritional value as well as a change in colour, flavour or smell.
When bacteria spores become active again, leading to bacterial growth and food spoilage.
High-temperature treatment of food or kitchen utensils in which all microorganisms and spores are killed.
Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce in more friendly conditions.
Process of natural decomposition of fruit and vegetables.

## Microorganisms in food production (Table Fill)

Coagulated milk – one of the steps of cheese production.
Milky liquid – a by-product of cheese production, drained from the cheese and used as a beverage or animal feed.
Enzyme used to coagulate milk in cheese production.
Bacteria used in cheese production, added to begin the process of milk fermentation.
Sugar which occurs naturally in milk.
What lactose is turned into during bacterial fermentation
Process in which sugar is turned into another substance, used in yoghurt and cheese production.
Invisible and odorless gas produced in sugar fermentation, which helps to obtain fizzy beverages and causes dough to rise.
One of the products of yeast fermentation, used in beer and wine production.
Harmless bacteria used in food manufacturing.
Product of milk fermentation with the use of probiotic bacteria.
Traditional British cheese made with the use of mould.
Traditional French cheese made with the use of mould, with a characteristic white skin.
Single-celled fungus used as leavening agent in the manufacturing of bread.

## Buying and storing food (Table Fill)

Range of temperatures at which the growth of microorganisms is the fastest, usually between 5 and 63 degrees Celsius.
Temperature of the air surrounding us, usually considered to be between 20 and 25 degrees Celsius, in which dry, sealed food can be safely stored.
When a strong smell from one food goes into another, less strongly smelling, food product.
Storing food at temperatures between 0 and 5 degrees Celsius, usually in a fridge or cooling counter.
Storing food at temperatures below 0 degrees Celsius, in order to stop bacterial growth and preserve nutritional value.
Date mark which applies to food for its shelf life, usually used for dry foods such as biscuits or pasta.
Date mark which applies to food safety, after which the food cannot be eaten any more; usually used for fresh, unprocessed foods.
A condition that occurs to frozen foods if they are not covered properly and air reaches them, causing oxidation and dehydration.
Defrosting – changing the physical state of food from solid and hard to soft or liquid, caused by increased temperature.
Durability – the amount of time during which a food can be safely stored and eaten.
Endothermic process of changing the state of a food from solid to liquid or hard to soft by changing the temperature it is stored at.
Obligatory – necessary to include on a food label.
British government agency responsible for protecting public health in relation to food.
The origin of food – place where the food comes from.
Amount of macro- and micronutrients present in a given food, ingredient or meal.
One of the mandatory elements of a food label, in which all the contents of the food are listed in descending order.
Statement on a food label indicating that consumption of a given food or an ingredient it contains is advantageous to health.
Statement on a food label indicating the presence of a given ingredient, usually added for health purposes.
Reduction in price.
Shop, supermarket or food seller which has a good reputation and can ensure the quality and safety of the food on offer.
Foods which have a long shelf life and don't pose a risk of food poisoning.

INSPECTION COPY

PROTECTED**

## Preparing and cooking food (Table Fill)

The most common cause of food poisoning in the UK, found in offal and poultry.
The most common cause of hospital admissions from food poisoning in the UK, typically associated with raw eggs.
Bacteria species naturally occurring in the human intestines but which is harmful if eaten.
One of the most common reasons for food poisoning, found in unpasteurised milk.
Bacterium commonly found on the skin, which produces toxins and causes food poisoning when eaten.
Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
Perishable food product usually associated with food poisoning – the only one which should not be eaten after the best before date.
Item of clothing used to prevent hair from falling into food.
Item of clothing used to protect the cook's clothes and body from dirt, stains or damage caused by oil splattering.
When a poisonous agent, pathogen or food particle is transferred from one food to another by touching it, having contact with dripping, etc.
When a poisonous agent, pathogen or food particle is transferred to a food via polluted hands, tools, utensils or other carriers.
Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
Process in which microorganisms are killed, usually with the use of high temperatures or antibacterial sprays.
Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce in more friendly conditions.
Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning or food allergy.
Habits and actions taken by individuals in order to prevent food contamination or poisoning.
The number of degrees Celsius or Fahrenheit in the centre of a cooked food product.
All the actions and procedures taken to ensure that food is not harmful and is secure to eat.
Electronic tool used to measure the temperature inside food.
Harmful bacteria that cause diseases and poisoning.
State in which microorganisms' life functions are slowed down and all activity is minimised in order to survive unfriendly conditions such as low temperatures and allow for later growth.
Harmful substance released by microorganisms and other organisms, usually bitter in taste, which causes poisoning.
Substances or ingredients present in a food which may pose a possible danger to someone who is especially sensitive or susceptible to them.

## ***Balanced diet and guidelines***

<b><i>overnutrition</i></b>	State in which excessive amounts of macro- or micronutrients are consumed, which may lead to many diet-related health conditions.
<b><i>undernutrition</i></b>	State in which insufficient macro- and micronutrients are consumed, leading to weight loss and diseases caused by nutrient deficiencies.
<b><i>obesity</i></b>	Condition in which abnormally high levels of adipose tissue are present in the body, usually caused by excessive intake of macronutrients.
<b><i>Body Mass Index</i></b>	Ratio of body mass to height squared ( $\text{kg}/\text{m}^2$ ), used to determine if someone's weight is optimal for their height.
<b><i>free sugars</i></b>	Sugars added to food products, as opposed to the sugars naturally found in foods, consumption of which should be limited to reduce the risk of obesity and dental caries.
<b><i>intrinsic sugars</i></b>	Sugars naturally occurring in food products, as opposed to free sugars.
<b><i>sedentary lifestyle</i></b>	Lifestyle habits and behaviours which include little or no physical activity.
<b><i>physical activity</i></b>	Movement of the body which requires energy expenditure.
<b><i>balanced diet</i></b>	Diet which provides the correct quantity and quality of macronutrients and micronutrients to support health and well-being.
<b><i>Eatwell Guide</i></b>	Dietary guideline in the shape of a plate which illustrates the proportions of food product and how much of each of them should be consumed.
<b><i>five a day</i></b>	Dietary guideline which recommends eating around five portions of fruit and vegetables a day, divided into five portions.
<b><i>glucose</i></b>	Simple sugar which is a basic source of energy for the human body.

INSPECTION COPY

PROTECTED

## Major diet-related health issues

<b>diabetes</b>	Chronic disease caused by insufficient performance where abnormally high blood sugar levels occur.
<b>coronary heart disease</b>	Condition in which heart blood vessels are narrowed by cholesterol plaque, which may lead to heart attack.
<b>breast cancer</b>	Mammary gland tumour, for which risk factors include alcohol and lack of exercise, as well as hormonal changes.
<b>bowel cancer</b>	Tumour of the lower digestive tract, for which risk factors include consumption of dietary fibre, obesity and unhealthy diet.
<b>arthritis</b>	Condition in which crystals accumulate in joints, causing difficulty walking, often as a result of unhealthy diet.
<b>stroke</b>	State in which blood is not provided to the brain, often due to a blood clot, causing damage and death to the brain.
<b>hypertension</b>	Abnormally high blood pressure, characteristic of many diet-related health issues.
<b>osteoporosis</b>	Condition in which bones lose their density and become brittle, leading to break.
<b>tooth decay</b>	Condition in which enamel is damaged by bacteria and acids.
<b>iron deficiency anaemia</b>	Condition caused by iron deficiency or an inability to absorb iron from the diet.
<b>immune system</b>	The body's defence system, protecting it from infections, bacteria and viruses.
<b>malnutrition</b>	State in which insufficient amounts of macro- and micro-nutrients are provided.
<b>atherosclerosis</b>	Condition in which veins and arteries are narrowed by cholesterol accumulation.
<b>coronary arteries</b>	The blood vessels which pump blood to the heart.
<b>insulin</b>	Important hormone, produced in the pancreas, which helps to lower blood sugar levels.
<b>pancreas</b>	Important organ which produces enzymes which help with digestion and hormones which regulate blood sugar levels.
<b>diverticulitis</b>	Inflammation of the pouches within the large intestine, often caused by symptoms and requires a low-fibre diet to minimise symptoms.

# ***Nutritional and dietary needs of different groups of***

<b><i>balanced diet</i></b>	Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts to allow proper growth and health of the body.
<b><i>coeliac disease</i></b>	Disease characterised by immune reaction to gluten, which damages the villi in the intestines and nutrient malabsorption.
<b><i>lactose intolerance</i></b>	Condition (usually acquired) in which milk sugar (lactose) is not properly digested, causing bloating, stomach ache and diarrhoea.
<b><i>malnutrition</i></b>	State in which insufficient amounts of macro- and micronutrients are provided.
<b><i>micronutrients</i></b>	Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
<b><i>macronutrients</i></b>	Chemical substances necessary for building the body, needed in large amounts.
<b><i>portion size</i></b>	Amount of food eaten in one meal, usually different for different age, sex and body size.
<b><i>free sugars</i></b>	Consumption of this type of sugar should be limited to avoid excessive calorie intake.
<b><i>omega-3</i></b>	Essential fatty acids, present in large amounts in fish oil, located at the third carbon atom from the end of the chain.
<b><i>dietary fibre</i></b>	Substance necessary for proper digestion and blood sugar levels and lowering the risk of bowel disease.
<b><i>hydration</i></b>	Process of supplying a sufficient level of water in the body.
<b><i>family budget</i></b>	Amount of disposable income which a family can spend on, e.g. food or entertainment.
<b><i>peer pressure</i></b>	Children's ability to pressure their parents into buying certain items.
<b><i>growth spurt</i></b>	Period in which the body grows rapidly, i.e. in early adolescence.
<b><i>peak bone mass</i></b>	The maximum bone density, reached during adolescence, thanks to calcium accumulation.
<b><i>menstruation</i></b>	Natural process in a female body which increases the risk of otherwise anaemia may occur.
<b><i>iron deficiency anaemia</i></b>	Condition caused by iron deficiency or inability to absorb iron.
<b><i>energy-dense food</i></b>	Food which provides many calories in one gram.
<b><i>gluten</i></b>	Protein which is present in some cereals, such as wheat, which cannot be eaten by people with coeliac disease.
<b><i>blood sugar level</i></b>	Glycaemia, or the amount of glucose present in the blood.
<b><i>lactation</i></b>	Process and period of time during which mammals feed a baby.
<b><i>alcohol</i></b>	Inorganic substance produced by the fermentation of sugars, damaging to the health if too much is drunk.

**Nutritional needs when selecting recipes for different**

<b>food table</b>	Table which shows detailed nutritional information for ingredients.
<b>nutritional value</b>	Amount of macro- and micronutrients present in a meal.
<b>macronutrients</b>	Chemical substances necessary for building the body, needed in large amounts.
<b>micronutrients</b>	Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
<b>balance</b>	State in which sufficient, appropriate amounts of nutrients are provided.
<b>healthy diet</b>	Regimen in which the "right" macronutrients and micronutrients, in sufficient appropriate amounts, from various sources are consumed.
<b>dietary diary</b>	A type of notes or calendar in which all foods eaten at a certain time are written in order to assess one's diet or to track nutrient intake.
<b>starch</b>	Digestible polysaccharide present in rice, bread, potatoes, etc. It consists of long chains of glucose particles joined together.
<b>dietary fibre</b>	Substance necessary for proper digestion and bowel movement, helps to keep blood sugar levels and lowering the risk of bowel diseases.
<b>portion size</b>	Amount of food eaten in one meal, usually different for different age, sex and body size.
<b>saturated fats</b>	Type of fats in which all the chemical bonds are saturated. They are found in large amounts in lard or butter.
<b>sugar</b>	Organic macromolecules produced by plants during photosynthesis. They are found in a range of food products in the form of single or double sugars.

# Energy balance

<b>kilocalorie</b>	Unit used to measure energy, which equals approx 4.2 kJ
<b>energy-dense food</b>	Food which provides many calories in one gram
<b>primary source</b>	Easily available source of energy which is used first
<b>secondary source</b>	Source of energy which is used only if other resources are exhausted
<b>Basal Metabolic Rate</b>	Amount of energy necessary for conducting basic functions such as breathing or heartbeat.
<b>Physical Activity Level</b>	Indicator of the amount of energy needed to perform activities such as walking, running, sleeping, showering, etc.
<b>energy source</b>	Food rich in certain macromolecules, such as carbohydrates, which can be consumed readily to provide power.
<b>kilojoule</b>	Unit used to measure energy, equals to 0.24 kilocalories
<b>fats</b>	Triglycerides – energy-dense macromolecules present in food which should provide up to 35% of daily calorie intake
<b>carbohydrates</b>	Group of macronutrients which should provide approx 50% of calorie intake, usually along with group B vitamins and minerals
<b>proteins</b>	Group of macronutrients which should constitute approx 15% of calorie intake.
<b>obesity</b>	Condition in which abnormally high levels of adipose tissue in the body, usually caused by excessive intake of macromolecules
<b>weight loss</b>	What happens to the body when the energy balance is negative (more energy is burnt than is provided in the diet).
<b>energy balance</b>	Situation in which energy consumption and expenditure are equal
<b>lifestyle</b>	The way in which a person lives and how active they are, which significantly affects energy needs.

## Protein (macronutrients)

<b>protein</b>	Long chains of amino acids that are the building blocks for growth and development, and make up 15% of a healthy diet.
<b>low biological value</b>	Type of protein in which some of the essential amino acids are in small amounts or lacking; usually of plant origin.
<b>high biological value</b>	Type of protein in which all essential amino acids are present in sufficient amounts; usually of animal origin.
<b>denaturation</b>	A process that happens to proteins at high temperature or in an acidic environment or as an effect of mechanical action.
<b>protein complementation</b>	Combining two or more low biological value proteins to create a high biological value meal.
<b>protein alternatives</b>	Protein-rich products made without the use of animal products.
<b>mycoprotein</b>	A protein-rich product made by <i>Fusarium venenatum</i> (Mycoprotein).
<b>coagulation</b>	What happens to proteins when the molecules are heated or exposed to salt.
<b>amino acids</b>	Nitrogen-based molecules that bind together to form proteins.
<b>essential amino acids</b>	Amino acids which cannot be produced by the human body and have to be provided as a part of a healthy diet.
<b>non-essential amino acids</b>	Amino acids which can be built by the human body from other nutrients.
<b>soya</b>	Type of bean rich in high biological value protein and used in many other products, such as flour, oil, sauce or tofu.
<b>quinoa</b>	Tiny, easy-to-digest, gluten-free grains originating from the Andes. They are high in carbohydrates, protein and fibre, and used as a staple food.
<b>kwashiorkor</b>	Condition caused by prolonged deficiency of protein in developing countries and characterised by swelling and skin lesions.
<b>textured vegetable protein</b>	A by-product of extracting oil from soya beans, used as a meat substitute.
<b>tofu</b>	Protein alternative made from coagulated soya milk, sold in soft blocks, characteristic of Asian cuisine and a popular vegetarian protein source.
<b>miso</b>	Traditional Japanese paste made of fermented soya beans and used in soups and spreads.

## **Fat (macronutrients)**

<b>fat</b>	An energy-dense macromolecule built from glycerol and fatty acids, necessary for building hormones and insulin.
<b>saturated fat</b>	Type of fat in which all the chemical bonds are single bonds.
<b>unsaturated fat</b>	Type of fat in which one or more double chemical bonds are present.
<b>obesity</b>	Condition in which abnormally high levels of adipose tissue are in the body, usually caused by excessive intake of macronutrients.
<b>polyunsaturated fat</b>	Type of fat where more than one double chemical bond is present in the acid chain.
<b>monounsaturated fat</b>	Type of fat where only one double chemical bond is present in the acid chain.
<b>trans fats</b>	Type of fats which are produced as a result of hydrogenation at high temperatures for a long time.
<b>adipose tissue</b>	Connective tissue whose main function is to store energy and to cushion organs.
<b>emulsion</b>	A mixture of oil and water.
<b>invisible fat</b>	A fat which is naturally present in foods and which is not visible after extraction.
<b>visible fat</b>	A fat which is naturally present in foods and which is visible as fatty tissue or oil.
<b>suet</b>	Visible fat surrounding the loins and kidneys of a carcass, composed of saturated fats and characteristic of traditional British cooking.
<b>fish oil</b>	The only animal-derived fat which is liquid at room temperature.
<b>triglyceride</b>	The chemical name for a fat molecule.
<b>fatty acids</b>	Three long hydrocarbon chains attached to a glycerol backbone molecule of fat.
<b>cholesterol</b>	Fatty substance necessary for building cell membranes and the gall bladder.
<b>LDL cholesterol</b>	Low-density fraction of cholesterol which transports cholesterol to and to the cells.
<b>HDL cholesterol</b>	High-density fraction of cholesterol which transports cholesterol from the liver, and lowers blood cholesterol levels.
<b>essential fatty acids</b>	Fatty acids which cannot be built by the human body and must therefore be provided as a part of a healthy diet.
<b>lipid</b>	A group of chemical substances which include fatty acids, triglycerides and sterols, and which are insoluble in water.
<b>type 2 diabetes</b>	Chronic disease characterised by high blood sugar levels, often as a result of high fat intake and obesity.
<b>weight loss</b>	One of the first signs of fat deficiency in a diet, where a person loses body weight.

PROTECTED**

## Carbohydrate (macronutrients)

<b>carbohydrates</b>	Large organic macromolecules produced by plants and which include sugars, starch and fibre.
<b>sugar</b>	Organic macromolecules produced by plants during photosynthesis and found in a range of food products in the form of single or double sugars.
<b>starch</b>	Organic macromolecules produced by plants, broken down into glucose to store energy for later.
<b>dietary fibre</b>	Substance occurring in plant cells only, usually in the form of cellulose, necessary for maintaining health.
<b>monosaccharides</b>	Carbohydrates built from one molecule only.
<b>polysaccharides</b>	Carbohydrate which is built from large numbers of monosaccharides into long chains.
<b>glucose</b>	A simple sugar which is a basic source of energy for the human body.
<b>lactose</b>	Disaccharide present in milk.
<b>free sugar</b>	Sugars added to food products, as opposed to those naturally occurring in foods.
<b>glycogen</b>	Polysaccharide stored in the liver and muscle cells as a source of energy.
<b>insoluble fibre</b>	Type of fibre which absorbs water and enhances bowel movement in the form of cellulose or lignin.
<b>soluble fibre</b>	Type of fibre which swells in the stomach giving a feeling of fullness usually in the form of pectin or gum.
<b>disaccharides</b>	Carbohydrates built from two particles of sugar joined together, such as lactose and sucrose.
<b>sucrose</b>	Commonly used sweet substance built from one molecule of fructose, obtained from sugar beet and cane.
<b>maltose</b>	Disaccharide built from two molecules of glucose found in grains.
<b>galactose</b>	Monosaccharide which, together with glucose, forms lactose, a milk sugar.
<b>fructose</b>	A simple sugar built from five atoms of carbon, normally found in fruit.
<b>wholemeal</b>	Flour made from whole grain, without separating out the bran.
<b>pectin</b>	Type of soluble fibre, present in fruit, which acts as a thickener.
<b>tooth decay</b>	A condition in which enamel is damaged by bacteria eating.
<b>intrinsic sugar</b>	Sugars that occur naturally in food products, as opposed to those added.
<b>weight loss</b>	One of the first noticeable signs of carbohydrate deficiency is a decrease in body weight.

INSPECTION COPY

COPYRIGHT  
PROTECTED

## Vitamins (micronutrients)

<b>vitamins</b>	Organic molecules needed in very small amount in diet but some can also be produced in the body.
<b>antioxidant</b>	Chemical substance or molecule which has the ability to reduce the damage caused by free radicals.
<b>retinol</b>	Form of vitamin A found in animal-derived foods.
<b>beta-carotene</b>	Form of vitamin A found in fruit and vegetables.
<b>night blindness</b>	Eyesight condition caused by vitamin A deficiency.
<b>rickets</b>	Childhood disease caused by an imbalanced, micronutrient diet.
<b>osteoporosis</b>	Condition in which bones lose their density and become brittle and break.
<b>gut microflora</b>	Beneficial bacteria living in the intestines, where they aid in the absorption of vitamins, e.g. vitamin K.
<b>supplement</b>	A pill or capsule taken to top up micronutrient levels and improve overall health.
<b>thiamine</b>	The chemical name for vitamin B1, deficiency of which causes beriberi.
<b>riboflavin</b>	The chemical name for a water-soluble vitamin which helps release energy from foods (vitamin B2).
<b>niacin</b>	The chemical name for vitamin B3, necessary for energy production, found in lean meat, eggs and milk.
<b>folic acid</b>	The chemical name for vitamin B9, crucial for proper development of the spinal cord and for the production of red blood cells.
<b>spina bifida</b>	Condition caused by folate deficiency during the development of the fetus.
<b>beriberi</b>	Disease caused by thiamine deficiency, symptoms include weakness and weakening of the muscles leading to paralysis.
<b>pernicious anaemia</b>	Type of anaemia caused by vitamin B12 deficiency, where the body cannot absorb enough of the vitamin from food.
<b>scurvy</b>	Disease caused by vitamin C deficiency, the main symptoms are swollen, receding and bleeding gums, and tooth loss.
<b>tocopherol</b>	The chemical name for vitamin E, found in vegetable oils.
<b>pellagra</b>	Disease caused by niacin deficiency, characterised by skin lesions and digestive problems.
<b>free radicals</b>	Atoms or molecules which lack electrons and steal them from other molecules, causing damage and oxidative stress.
<b>cobalamin</b>	The chemical name for vitamin B12, found mainly in animal products.
<b>ascorbic acid</b>	The chemical name for vitamin C, found mainly in fruits and vegetables such as potatoes, blueberries or cabbage.
<b>cholecalciferol</b>	The chemical name for vitamin D, present in large amounts in animal products and oily fish, and also produced in the skin when exposed to sunlight.

## Minerals and water (micronutrients)

<b>osteoporosis</b>	Condition in adults in which bones lose their density and become easy to break.
<b>tooth decay</b>	Condition caused by improper fluoride intake and bacteria. Enamel becomes damaged by acids and bacteria.
<b>enamel</b>	The hardest tissue in the human body, which forms the surface of teeth.
<b>dairy</b>	Products made from milk, often high in calcium.
<b>anaemia</b>	Condition caused by a deficiency of micronutrients iron, vitamin B12 and folate, characterised by low red blood cell count.
<b>hypertension</b>	Abnormally high blood pressure, usually caused by narrowing of the blood vessels or certain hormones.
<b>fluoridation</b>	Process in which drinking water is enriched in fluoride.
<b>thyroid gland</b>	Small gland in front of the neck which produces hormones to regulate proper metabolism.
<b>goitre</b>	Condition caused by iodine deficiency, symptoms include swelling of the neck and changes in metabolism.
<b>haemoglobin</b>	Red pigment in blood cells, built from four peptide chains and iron atoms, responsible for transporting oxygen in the blood.
<b>shellfish</b>	Invertebrate marine organisms used as food which are often high in iodine.
<b>dehydration</b>	State caused by excessive loss and insufficient intake of water, usually as the result of excessive sweating or exposure to heat.
<b>heatstroke</b>	Serious condition in which the body cannot cool itself down, so hot that it becomes dangerous, e.g. as the result of dehydration.
<b>sweat</b>	Liquid, salty secretion from glands located mainly in the skin pores all over the body.
<b>water intoxication</b>	Condition caused by hyperhydration, in which electrolytes become too diluted, resulting in fatal swelling of the brain.
<b>detoxication</b>	Function of water whereby harmful substances are removed from the body.
<b>calcium</b>	Chemical element found in milk, dairy products and green leafy vegetables. It is necessary for the proper development and growth of bones and teeth.
<b>iron</b>	Element necessary for building red blood cells, found in meat and eggs, but which is harder to ingest from plants.
<b>sodium</b>	An electrolyte – an element necessary for proper nerve impulses and regulating blood pressure.
<b>fluoride</b>	Chemical trace element necessary for the proper development of enamel.
<b>iodine</b>	Trace element necessary for building thyroid hormones and regulating rate of metabolism in the body.
<b>phosphorus</b>	One of the elements necessary for the proper metabolism. It is also needed to release energy and build DNA.
<b>mineral</b>	Inorganic chemical element necessary for the body to conduct electric impulses or build hormones.

INSPECTION COPY

COPYRIGHT  
PROTECTED

## Food source and supply

<b>food provenance</b>	The origin of food – place where the food comes from or manufactured.
<b>pesticide</b>	Chemical substance sprayed on fields and orchards to kill pests caused by insects.
<b>fertiliser</b>	Chemical, nutrient-rich mixture used to enrich soil in order to obtain higher crop yield.
<b>genetically modified</b>	Plant or animal whose DNA code has been manipulated to enhance more desirable features.
<b>organic</b>	Food product produced without the use of any artificial pesticides, antibiotics or growth feeds or fertilisers.
<b>import</b>	Bringing or transporting goods from another country.
<b>polytunnel</b>	Long transparent plastic tube used in farming in order to grow plants and protect them from unfavourable weather.
<b>hydroponic</b>	Plant growing method in which roots are placed in water and used to grow lettuces or radishes.
<b>staple food</b>	Food product which is eaten in large quantities as a part of regional or national diet, usually due to climate or geography allowing the growth and rearing of certain food products.
<b>free-range</b>	Method of egg production in which hens can move freely and eggs from such hens are labelled 1.
<b>fish farm</b>	Artificial fishery built in order to protect natural fish stocks and sustainability.
<b>animal welfare</b>	The idea which advocates humane conditions and treatment of animals.
<b>DNA</b>	Spiral molecule locked in the nucleus of a cell, which carries genetic information about a person, animal or plant.
<b>gene</b>	Part of a DNA molecule which carries specific information about a flower or size of a fruit.
<b>gathered ingredients</b>	Foods such as mushrooms, herbs, roots and wild fruits which are but are looked for in the wild.
<b>seasonal foods</b>	Food characteristic of a given time of year.
<b>venison</b>	The meat of a deer.
<b>hunting</b>	Activity during which people catch and kill wild animals using the use of specially trained dogs.
<b>reared ingredients</b>	Foods made from animals which were purposely bred to obtain milk, egg, meat or other benefits.
<b>livestock</b>	All animals reared on a farm for meat or other products.
<b>poultry</b>	The meat of domesticated birds, such as chickens, ducks and geese.
<b>game</b>	The meat of caught animals, such as pheasant, wild boar and venison.

PROTECTED

# Food processing and production part 1

<b>probiotic bacteria</b>	Various bacteria species which are beneficial for food production.
<b>mould</b>	Furry microorganism which is used in blue cheese production but also causes bread and fruit spoilage.
<b>whey</b>	Milky liquid, a by-product of cheese production, which can be used as a beverage or animal feed.
<b>curd</b>	Coagulated milk – one of the steps of cheese production.
<b>secondary processing</b>	Processes which affect food's properties or turn it into a different form.
<b>unprocessed food</b>	Raw, unrefined food, usually freshly harvested.
<b>primary processing</b>	Early processing in which food is turned from raw into an edible, useable food product.
<b>gelatin</b>	Transparent, tasteless substance derived from animal collagen, used as a thickening agent.
<b>starter cultures</b>	Live bacteria added to pasteurised milk to begin the fermentation process during cheesemaking.
<b>pectin</b>	A type of fibre which occurs naturally in fruit and vegetables, used as a thickening agent.
<b>lactose</b>	Disaccharide which occurs naturally in milk and is converted into lactic acid during milk fermentation.
<b>lactic acid</b>	Acid produced from milk sugar during fermentation, giving cheese its tangy flavour.
<b>gluten</b>	Net-like protein in wheat, rye and barley, responsible for the structure and texture of bread.

INSPECTION COPY

COPYRIGHT  
PROTECTED

## ***Food processing and production part 2***

<b><i>harvesting</i></b>	Gathering the crops from a field or orchard.
<b><i>milling</i></b>	Pulverising – turning grain into powder.
<b><i>pasteurisation</i></b>	Process of gently heating a liquid or a food product to kill harmful bacteria and make food safe to eat.
<b><i>sterilisation</i></b>	Heat treatment of milk and meat preserves in which is heated to 130°C for 30 minutes to kill all bacteria and spores to increase the shelf life of the finished product.
<b><i>microfiltration</i></b>	Pressing milk through very fine membranes in order to remove bacteria.
<b><i>fermentation</i></b>	Turning milk into yoghurt or cheese with the use of bacteria.
<b><i>freeze-drying</i></b>	Freezing food and removing moisture afterward to increase shelf life without affecting nutritional value of a product.
<b><i>salting</i></b>	Important step in the production of cheese, in which cheese is soaked or coated with brine in order to improve its taste and texture.
<b><i>skimming</i></b>	Process of decreasing the amount of fat in milk.
<b><i>homogenisation</i></b>	Process of decreasing the size of fat particles in milk by passing through tiny holes to obtain a stable mixture.
<b><i>churning</i></b>	Process of turning milk or cream into butter.
<b><i>cream</i></b>	Dairy product made of the fat layer skimmed off milk after homogenisation.
<b><i>blast chilling</i></b>	Preserving method in which cooked food is quickly cooled to low degrees Celsius to prevent bacterial growth and extend shelf life.
<b><i>controlled atmosphere packaging</i></b>	Storing and packaging food in conditions where oxygen, carbon dioxide concentrations, air humidity and temperature are controlled.
<b><i>modified atmosphere packaging</i></b>	Storing and packaging food in conditions where the atmosphere is modified to improve the food's shelf life and prevent spoilage.

INSPECTION COPY

**COPYRIGHT  
PROTECTED**

## Food security part 1

<b>recycling</b>	Process of turning a used product (e.g. newspaper paper).
<b>carbon dioxide</b>	Invisible, odourless gas produced in large amounts and transportation, capable of trapping warmth.
<b>greenhouse gases</b>	CO <sub>2</sub> , methane, nitrous oxide, ozone and water vapour have the potential to trap warmth around the Earth, causing global warming.
<b>plastic</b>	Synthetic, usually elastic compound which is very durable and which is used to produce food packaging.
<b>styrofoam</b>	Light, white synthetic material which does not conduct heat, used to insulate and protect goods.
<b>carbon footprint</b>	Amount of CO <sub>2</sub> released during the production and distribution of a good, e.g. a food product.
<b>food miles</b>	The distance a food has to travel from a farm to a consumer.
<b>seasonal foods</b>	Foods characteristic of a given time of year.
<b>Red Tractor scheme</b>	Food assurance scheme which ensures food safety, environmental protection and animal welfare in the UK.
<b>sustainability</b>	Ability to produce sufficient amounts of food, energy and other resources, which remains stable and diverse.
<b>organic</b>	Food product produced without the use of any artificial pesticides, antibiotics or GM feeds or fertilisers.
<b>fossil fuels</b>	Naturally occurring, non-renewable sources of energy, such as oil, coal and gas, the result of anaerobic decomposition of organic matter over millions of years.
<b>natural resources</b>	Naturally occurring, usually non-renewable resources, such as water, coal or wood.
<b>global warming</b>	Situation in which the average temperature on Earth is rising, due to anomalies and melting of glaciers.
<b>biodegradable</b>	Able to be broken down in natural conditions, e.g. by bacteria.
<b>food waste</b>	All food which has not been eaten for various reasons, e.g. of due to spoilage, an exceeded date mark or an error in production.

INSPECTION COPY

COPYRIGHT  
PROTECTED

## Food security part 2

<b>food security</b>	State in which everybody around the world has access to a healthy, nutritious food.
<b>import</b>	Bringing or transporting goods from another country.
<b>developing countries</b>	Poor, unindustrialised countries which are attempting to increase their growth rate and quality of life by trading and importing new technologies.
<b>undernutrition</b>	State in which a person does not provide sufficient energy and/or micronutrients, often leading to deficiency-related health problems.
<b>global warming</b>	Situation in which the average temperature on Earth is increasing due to anomalies and melting of glaciers.
<b>greenhouse gases</b>	CO <sub>2</sub> , methane, nitrous oxide, ozone and water vapour. They have the potential to trap warmth around the Earth, leading to global warming.
<b>Fairtrade</b>	Ethical way of trading between developed and developing countries that allows fair prices and wages for the farmers and workers.
<b>drought</b>	State in which no rainfall has occurred for a prolonged period, leading to crop failure and major problems with food production.
<b>flood</b>	State in which massive rainfall has occurred for a prolonged period, causing rivers to leave their beds and swamp the surrounding land.
<b>glacier</b>	Ice or snow mass formed at the tops of mountains and moving slowly down the slopes.
<b>genetically modified</b>	Plant or animal whose DNA code has been manipulated to enhance more desirable features.
<b>fossil fuels</b>	Naturally occurring, non-renewable sources of energy that are the result of anaerobic decomposition of organic matter over millions of years.
<b>carbon footprint</b>	Amount of CO <sub>2</sub> released during the production and distribution of a good, e.g. a food product.
<b>food miles</b>	The distance a food has to travel from a farm to a consumer.
<b>pesticides</b>	Chemical substance sprayed on fields and orchards to kill or control pests caused by insects.
<b>fertilisers</b>	Chemical substances used to enrich and improve the soil to obtain higher crop yields.
<b>fish farm</b>	Artificial fishery built in a pond to protect natural fish stocks and sustainability.
<b>biodiversity</b>	Varied types of species occurring in the environment.
<b>fishery</b>	Place where fish are caught or reared, either in the wild or in a fish farm.
<b>overfishing</b>	State in which too many fish are caught, leading to depletion of the shoal or the extinction of the species.
<b>by-catch</b>	Accidentally catching fish or other animals which were not the target of the catch.

INSPECTION COPY

COPYRIGHT  
PROTECTED

## ***Technological developments to support better health***

<b><i>fortification</i></b>	Addition of nutrients to a given product to improve its nutritional value.
<b><i>mandatory</i></b>	Obligatory – necessary to add to a food product.
<b><i>wholemeal flour</i></b>	Kind of flour which does not have to be fortified as it has not been affected by processing.
<b><i>skimmed milk</i></b>	Kind of milk which has to be fortified by law due to its low fat content.
<b><i>margarine</i></b>	Soft, spreadable mixture made of hydrogenated vegetable oil, and fortified in vitamins A and D by law.
<b><i>thiamine</i></b>	A vitamin added to plain flour by law to restore the deficiency of which may cause beriberi disease.
<b><i>niacin</i></b>	A vitamin added to plain flour by law to reduce the risk of its deficiency.
<b><i>iron</i></b>	A mineral added to plain flour by law to prevent iron deficiency.
<b><i>calcium</i></b>	A mineral added to plain flour by law to prevent osteoporosis.
<b><i>vitamin A</i></b>	Substance added to fat spreads and skimmed milk to prevent deficiency.
<b><i>colourant</i></b>	Pigment – agent used to change or enhance the colour of a food.
<b><i>emulsifier</i></b>	Substance used to improve the texture of food and to mix ingredients.
<b><i>flavouring</i></b>	Agent used to change or enhance the taste and smell of a food.
<b><i>sweetener</i></b>	Natural or synthetic substance used to replace the calorific value of a food.
<b><i>preservative</i></b>	Natural or synthetic agent used to enhance the shelf life and prevent spoilage.
<b><i>cholesterol</i></b>	Fatty substance which does not occur in vegetable oils and can cause many diet-related conditions.
<b><i>phytosterols</i></b>	Naturally occurring molecules found in plant substances which have the potential to lower blood cholesterol level and decrease the risk of heart failure.
<b><i>stabiliser</i></b>	Additive used to maintain a food's chemical structure.
<b><i>nitrites</i></b>	Chemical substances containing nitrogen, used in meats to prevent the growth of <i>Clostridium botulinum</i> and to maintain the colour of the food product.
<b><i>probiotic</i></b>	Microorganisms (usually bacteria species) which are consumed, present in, e.g. yoghurt or pickled cabbage.
<b><i>prebiotic</i></b>	Plant fibre or another substance which promotes the growth of bacteria, e.g. inulin found in onion.
<b><i>antioxidant</i></b>	Chemical substances, e.g. vitamin C, added to food to increase shelf life by preventing oxygen activity.
<b><i>thickener</i></b>	Substance such as modified starch used to increase the viscosity of a product.

INSPECTION COPY

PROTECTED**

## Development of culinary traditions

<b>cuisine</b>	Style of cooking characteristic of a country or region, including ingredients and cooking methods.
<b>Cheddar</b>	Britain's most popular traditional hard cheese, originating from Somerset.
<b>elevenes</b>	Small snacks or biscuits eaten before noon.
<b>afternoon tea</b>	Traditional British meal consisting of sandwiches and scones with tea.
<b>siesta</b>	Afternoon nap or rest typical of southern countries.
<b>antipasto</b>	Originating from Italy, a small snack eaten before a meal to stimulate the appetite.
<b>paella</b>	Traditional Spanish dish made of rice, vegetables, and meat, usually served in a shallow frying pan.
<b>wok</b>	Deep frying pan characteristic of Asia.
<b>chopsticks</b>	Cutlery items used instead of a knife and fork in many Asian cultures.
<b>tandoor</b>	Round clay oven used for cooking traditional Indian dishes.
<b>calzone</b>	A pizza that is folded before cooking.
<b>sushi</b>	Traditional Japanese dish made of rice, seaweed, and fish, often dipped in soy sauce or wasabi paste.
<b>haggis</b>	Traditional Scottish dish made from offal, oats, and spices, stuffed into a sheep's stomach.
<b>Mediterranean</b>	Style of cooking characteristic of the south of Europe, featuring olive oil, vegetables, and seafood.
<b>tagine</b>	Clay dish with a lid used for preparing traditional Moroccan stews.
<b>staple food</b>	Food product which constitutes the basis of a diet in a particular country.
<b>multicultural</b>	Cuisine which is formed from many different ethnic influences, showing a variety and diversity of ingredients and cooking methods.
<b>baklava</b>	Traditional dessert characteristic of Greece and Turkey, made of layers of pastry with a filling traditionally made from nuts and honey.

INSPECTION COPY

PROTECTED

## ***Personal, social, economical and medical reasons***

<b><i>Physical Activity Level</i></b>	Indicator of the amount of energy needed to perform activities such as walking, running, sleeping and showering.
<b><i>occasion</i></b>	Unusual or particularly important event; cause for celebration, enjoyment, during which festive foods and drinks are often consumed.
<b><i>price</i></b>	The cost of food – the amount of money one has to pay for it.
<b><i>food availability</i></b>	Situation in which food is present in the market for consumers to buy, thanks to modern farming methods, storage and imports.
<b><i>lifestyle</i></b>	Habits and actions of an individual – the way a person lives.
<b><i>seasonal</i></b>	Describes food that is characteristic of a given time of year.
<b><i>consumer</i></b>	Person who buys and eats foods – a client.
<b><i>food intolerance</i></b>	The negative reaction of the digestive system to a food, manifesting as stomach cramps or diarrhoea.
<b><i>food allergy</i></b>	The reaction of the immune system to a food ingredient, leading to anaphylactic shock.
<b><i>lactose</i></b>	The sugar naturally present in milk and one of the most common causes of food intolerance.
<b><i>gluten</i></b>	A protein present in wheat, rye and barley, and one of the most common causes of food intolerance.
<b><i>lactase</i></b>	The enzyme which breaks down milk sugar in the digestive system.
<b><i>coeliac disease</i></b>	Disease in which gluten cannot be digested and absorbed, leading to health problems followed for the person's entire life.
<b><i>globalisation</i></b>	Process of developing international and intercultural exchange, which can improve food availability and increase the choices of people even in very remote countries.
<b><i>anaphylactic shock</i></b>	Severe, life-threatening allergic reaction to food.

PROTECTED

## Religious, cultural, ethical and moral beliefs

<b>vegetarian</b>	Type of diet which does not allow consumption of animal-derived foods such as fish, milk or eggs.
<b>vegan</b>	Type of diet which does not allow consumption of animal products.
<b>culture</b>	All actions, traditions, ideas or beliefs characteristic of an ethnic group.
<b>pork</b>	The meat derived from a commonly reared animal, forbidden in some religions, such as Islam or Judaism.
<b>alcohol</b>	Chemical substance occurring in beverages, forbidden in some religions.
<b>ital</b>	The idea/movement which defines dietary restrictions.
<b>halal</b>	Food and other goods which are permissible for Muslims.
<b>kosher</b>	Food and other goods which are permissible for Jews.
<b>Diwali</b>	Hindu festival of lights, celebrated in autumn.
<b>Ramadan</b>	In Islam, a month-long fasting period during which no food or drink from sunrise to dusk.
<b>guru</b>	Person who is worshipped and whose teachings are followed.
<b>animal welfare</b>	The principle of humane treatment and conditions for animals.
<b>Fairtrade</b>	Ethical way of trading between developed and developing countries, which allows fair prices and wages for the farmers and workers.
<b>organic</b>	Food product produced without the use of any artificial pesticides, antibiotics, GM feeds or fertilisers.
<b>intensive farming</b>	Farming method which aims at minimising the cost of production by the use of modern technologies, pesticides, and fertilisers.
<b>genetically modified</b>	Plant or animal whose DNA code has been manipulated to enhance more desirable features.
<b>lacto-ovo-vegetarianism</b>	Variant of vegetarianism which allows the consumption of dairy products.
<b>lacto-vegetarianism</b>	Variant of vegetarianism which allows the consumption of dairy products.
<b>ovo-vegetarianism</b>	Variant of vegetarianism which allows the consumption of eggs.

## ***Reasons why food is cooked***

<b><i>food safety</i></b>	All actions and procedures taken to ensure that food is secure to eat.
<b><i>flavour</i></b>	The combined sensation of taste, smell and mouthfeel, which is altered and improved during cooking.
<b><i>texture</i></b>	The consistency of a food product, usually created by cooking.
<b><i>aroma</i></b>	The smell of food, usually more prominent in hot foods.
<b><i>palatability</i></b>	Term that refers to whether food is pleasurable to eat.
<b><i>raw</i></b>	Food which is in its natural state, before any heat treatment.
<b><i>shelf life</i></b>	Durability – the amount of time during which a food can be eaten.
<b><i>natural poisons</i></b>	Toxic substances naturally present in foods, which are neutralised during cooking.
<b><i>appetising</i></b>	Appealing – stimulating craving for a particular food.
<b><i>bacteria</i></b>	Tiny, omnipresent microorganisms which can cause food poisoning if it is uncooked or improperly cooked.
<b><i>tenderising</i></b>	Process of softening and improving the texture of meat by cooking, cutting it into pieces, or using a marinade.
<b><i>digestion</i></b>	Process of breaking down nutrients in the stomach and small intestine which can be ingested through the gut wall into the bloodstream.

# Heat transfer and cooking methods

<b>heat transfer</b>	Movement of thermal energy from one object to another, resulting in an increase in temperature.
<b>conduction</b>	Process in which heat is transferred directly to the pan's molecules.
<b>convection</b>	Process in which heat is transferred to food indirectly through a liquid or another medium, such as air.
<b>radiation</b>	Process in which heat is transferred to food indirectly through electromagnetic waves to it.
<b>microwaves</b>	Electromagnetic waves used in radars, radio transmitters, etc. can quickly heat up water molecules.
<b>infrared radiation</b>	Type of invisible radiation emitted by every living body. It can transfer heat to the food.
<b>steaming</b>	Moist cooking method in which water vapour/steam is used to cook food that are placed above boiling water.
<b>blanching</b>	The process in which vegetables are put into boiling water for a short time and then quickly dipped into ice-cold water.
<b>poaching</b>	Moist cooking method in which food is simmered in a small amount of liquid in order to keep its texture.
<b>braising</b>	Dry cooking method in which food is first sealed and then cooked for a long time.
<b>stir-fry</b>	Fat-based cooking method that originated in Asia. It involves the use of a wok and a small amount of oil or sauce.
<b>marinade</b>	Mixture of oil, acid, herbs and flavourings used to marinate meat.
<b>vitamin loss</b>	When various preparation and cooking methods lead to the loss of nutritional value of a food product.
<b>enzymatic browning</b>	The effect of plant cell damage, leading to a change in the nutritional value of a fruit or vegetable.
<b>oxidation</b>	The effect on food of exposure to air, leading to a loss of nutritional value as well as a change in flavour or smell.
<b>boiling</b>	Moist cooking method where a large amount of water is used and high degrees Celsius is used.
<b>simmering</b>	Moist cooking method in which food is kept below the boiling point (degrees Celsius) for a long time.
<b>baking</b>	Dry cooking method that involves using an oven to cook food.
<b>roasting</b>	Dry cooking method that uses a small amount of oil to prevent food from drying out.
<b>grilling</b>	Barbecuing – cooking food on a special grid, usually over an open fire.
<b>shallow-frying</b>	Fat-based cooking method which requires a small amount of oil. The heat and seal the surface of a food.
<b>deep-frying</b>	Fat-based cooking method in which food is sunk completely in oil.
<b>dry-frying</b>	Cooking in a pan without the use of oil or fat.

# Functional and chemical properties of proteins, fats

<b>denaturation</b>	What happens to proteins at high temperatures as an effect of mechanical action.
<b>coagulation</b>	What happens to proteins when the molecules are exposed to salt.
<b>gluten</b>	Protein formed when flour is mixed with water, which forms an elastic net and traps air bubbles within the mixture.
<b>foam</b>	Light, delicate structure in which air bubbles are trapped.
<b>marinade</b>	A solution of acid, oil, herbs and spices, used to prepare and tenderise them.
<b>curdling</b>	Denaturation of milk proteins in reaction to acid production.
<b>syneresis</b>	The process of separating water from overcooked food, e.g. in eggs.
<b>glutenin</b>	One of the proteins present in flour, which, in the presence of gluten.
<b>gliadin</b>	One of the proteins present in flour, which, in the presence of gluten.
<b>gelatinisation</b>	Reaction of starch to water and heating, in which starch granules break up, used to thicken sauces or cook a risotto.
<b>dextrinisation</b>	Reaction of starch to dry heating, in which long chains break up into shorter ones, creating a slight sweet flavour.
<b>caramelisation</b>	Reaction of sugar to high temperatures, in which sugar molecules break up and changes its colour and flavour.
<b>amylose</b>	Unbranched polysaccharide – one of the components of starch.
<b>amylopectin</b>	Branched polysaccharide – one of the components of starch.
<b>starch</b>	Long-chained carbohydrate present in potatoes, made up of amylose and amylopectin.
<b>shortening</b>	Process in which fat molecules surround starch granules during formation, causing pastry to be crumbly.
<b>aeration</b>	Process in which air bubbles are trapped in a mixture during formation.
<b>plasticity</b>	Ability of fats to change their physical state at room temperature so they can easily spread and reshaped.
<b>emulsification</b>	Process of mixing oil and water together to obtain a stable mixture, e.g. to prepare mayonnaise.
<b>melting point</b>	Temperature at which fat transforms into oil.
<b>hydrophobic</b>	Molecule which is repelled by water molecules and does not mix with it.
<b>lecithin</b>	Popular emulsifier naturally occurring in egg yolk.

# ***Functional and chemical properties of fruit, vegetable***

<b>enzymatic browning</b>	The effect of plant cell damage, leading to a change in the nutritional value of a fruit or vegetable.
<b>oxidation</b>	The effect on food of exposure to air, leading to a change in colour as well as a change in flavour or smell.
<b>iron</b>	Chemical element symbolised by Fe, used to make metal and kitchen equipment, which may increase the iron content in food.
<b>copper</b>	Chemical element symbolised by Cu, used to make metal. Known for its high electric and thermal conductivity. It can increase the rate of enzymatic browning in food.
<b>blanching</b>	The process in which vegetables are put into boiling water for a short time and then quickly dipped into ice-cold water.
<b>baking powder</b>	A mixture of sodium bicarbonate and calcium phosphate, used as a leavening agent.
<b>sodium bicarbonate</b>	White powder used as a leavening agent in acidic batters. It can cause a soapy flavour.
<b>carbon dioxide</b>	Gas which is produced as the result of baking powder or yeast in food.
<b>steam</b>	Vapour formed when water reaches its boiling point.
<b>self-raising flour</b>	Plain flour which has been enriched by the addition of other chemical raising agents.
<b>whisking</b>	Mechanical method of leavening which uses a whisk to incorporate air into a mixture.
<b>folding</b>	Mechanical method of leavening in which air is incorporated into a mixture by folding the mixture over itself.
<b>sieving</b>	Mechanical method of leavening in which air is incorporated into a mixture by sieving flour or icing sugar, used to make sponge cakes.
<b>sponge cake</b>	Springy, soft cake made of eggs, sugar and flour, leavened with baking powder.
<b>puff pastry</b>	Type of fatty pastry of many crumbly layers.
<b>yeast</b>	Microscopic, single-celled fungus used as a raising agent to produce carbon dioxide.
<b>fermentation</b>	Process in which sugar is converted into alcohol and carbon dioxide in bread dough and wine production.
<b>sugar</b>	Substance necessary for yeast budding.
<b>beating</b>	Mechanical action applied to batter in which air is incorporated into a liquid.
<b>creaming</b>	Mechanical leavening method applied to fat and sugar, in which air bubbles are surrounded by fat.
<b>rubbing in</b>	The action of gently massaging fat into flour to form a crumbly mixture and make it lighter.

# Sensory properties

<b>receptor</b>	Cell located in the skin and other organs, specialise in sending information to the brain.
<b>organoleptic qualities</b>	Properties and aspects of food which are perceived by the senses, especially taste and smell.
<b>taste buds</b>	Specialised receptors localised on the tongue which recognise and recognise flavours.
<b>umami</b>	The meaty, savoury taste.
<b>olfactory system</b>	The system used for recognising aromas.
<b>epithelium</b>	The tissue which covers all of the inner organs, such as the stomach and intestines.
<b>flavour</b>	The combined sensation of taste, smell and mouthfeel.
<b>fair testing</b>	Procedures taken to make sure all tasters have the same experience, in order to obtain reliable results.
<b>ranking test</b>	Sensory test used to assess the strength of a given property of food samples, e.g. sweetness of a drink.
<b>rating test</b>	Sensory test used to assess how much a property is present in a sample, e.g. spiciness of various brands of crisps.
<b>food carrier</b>	Piece of bread or wafer that is neutral in taste and texture, used for tasting to serve spreads and pastes.
<b>appetite</b>	Desire to eat a specific food product, as opposed to a general desire to eat.
<b>grading test</b>	Group of sensory tests used to create a ranking of food products.
<b>aesthetic qualities</b>	Features which make a food or a meal look good and appealing.
<b>triangle testing</b>	Type of sensory testing in which three samples are presented, two of which are identical, and the third is different.
<b>sensory profiling</b>	A test that aims to detail the appearance (sight), smell, taste and texture of food.

# Conditions for bacteria, mould and yeast growth, and food spoilage

<b>food spoilage</b>	Negative change in food properties caused by poor storage conditions.
<b>cross-contamination</b>	Transfer of microorganisms or food particles to another food item to cause food poisoning or anaphylactic shock.
<b>mould</b>	Tiny fungi used in blue cheese production and with bread and fruit, causing the food to spoil.
<b>bacteria</b>	Microscopic organisms of various shapes used in food production, but some also cause diseases and food poisoning.
<b>yeast</b>	Microscopic, single-celled fungus used in bread, beer and wine.
<b>enzymes</b>	Biochemical active, protein-based compounds needed for many life processes, which act as catalysts in chemical reactions.
<b>microorganism</b>	Microscopic organisms found everywhere in the environment, including the body and in food, which can cause food spoilage.
<b>fermentation</b>	Process conducted by bacteria or yeast in which carbon dioxide and other substances, such as alcohol are produced.
<b>alcohol</b>	Product of yeast fermentation used in wine and beer.
<b>aerobic</b>	Type of bacteria which need oxygen to live.
<b>anaerobic</b>	Type of bacteria which do not need oxygen to live.
<b>pathogens</b>	All agents capable of causing diseases, such as bacteria, viruses and fungi.
<b>high-risk foods</b>	Food products which offer the best conditions for microorganism growth to increase the risk of food poisoning, which include raw meat, dairy and ready-to-eat products.
<b>catalyst</b>	Substance or agent which speeds up the rate of a chemical reaction.
<b>food poisoning</b>	Reaction of the body to harmful microorganisms or toxins.
<b>optimal temperature</b>	Range of temperature which creates ideal conditions for microorganism growth and increases enzyme activity.
<b>enzymatic browning</b>	Effect of enzymatic action which leads to change in colour of food.
<b>blanching</b>	Heat treatment applied to vegetables and fruit to inactivate enzymes.
<b>oxidation</b>	The effect on food of exposure to air, leading to loss of nutritional value as well as a change in flavour or smell.
<b>germinate</b>	When bacteria spores become active again, leading to food spoilage.
<b>sterilisation</b>	High-temperature treatment of food or kitchen equipment to kill microorganisms and spores are killed.
<b>spores</b>	Form of bacteria or fungi resistant to high or low temperatures, which multiply and reproduce in more friendly conditions.
<b>natural decay</b>	Process of natural decomposition of fruit and vegetables.

## Microorganisms in food production

<b>curd</b>	Coagulated milk – one of the steps of cheese production.
<b>whey</b>	Milky liquid – a by-product of cheese production and used as a beverage or animal feed.
<b>rennet</b>	Enzyme used to coagulate milk in cheese production.
<b>starter cultures</b>	Bacteria used in cheese production, added to begin fermentation.
<b>lactose</b>	Sugar which occurs naturally in milk.
<b>lactic acid</b>	What lactose is turned into during bacterial fermentation.
<b>fermentation</b>	Process in which sugar is turned into another substance, e.g. cheese production.
<b>carbon dioxide</b>	Invisible and odourless gas produced in sugar fermentation. It is used to make fizzy drinks and causes dough to rise.
<b>alcohol</b>	One of the products of yeast fermentation, used in brewing.
<b>non-pathogenic</b>	Harmless bacteria used in food manufacturing.
<b>yoghurt</b>	Product of milk fermentation with the use of probiotics.
<b>Stilton</b>	Traditional British cheese made with the use of blue cheese cultures.
<b>Camembert</b>	Traditional French cheese made with the use of white skin.
<b>yeast</b>	Single-celled fungus used as leavening agent in bread making.

## Buying and storing food

<b>danger zone temperature</b>	Range of temperatures at which the growth of microorganisms is fastest, usually between 5 and 63 degrees Celsius.
<b>ambient temperature</b>	Temperature of the air surrounding us, usually between 15 and 25 degrees Celsius, in which dry, sealed food can be stored.
<b>tainting</b>	When a strong smell from one food goes into another food product.
<b>chilling</b>	Storing food at temperatures between 0 and 5 degrees Celsius in a fridge or cooling counter.
<b>freezing</b>	Storing food at temperatures below 0 degrees Celsius to stop bacterial growth and preserve nutritional value.
<b>best before</b>	Date mark which applies to food quality, usually biscuits and pasta.
<b>use by date</b>	Date mark which applies to food safety, after which it should not be eaten any more; usually used for fresh, unprocessed food.
<b>freezer burn</b>	A condition that occurs to frozen foods if they are exposed to air which reaches them, causing oxidation and dehydration.
<b>thawing</b>	Defrosting – changing the physical state of food from frozen to solid or liquid, caused by increased temperature.
<b>shelf life</b>	Durability – the amount of time during which a food item can be eaten.
<b>defrosting</b>	Endothermic process of changing the state of a food item from hard to soft by changing the temperature it is stored at.
<b>mandatory</b>	Obligatory – necessary to include on a food label.
<b>Food Standards Agency</b>	British government agency responsible for protecting public health in relation to food.
<b>provenance</b>	The origin of food – place where the food comes from.
<b>nutritional value</b>	Amount of macro- and micronutrients present in a food item or meal.
<b>ingredient list</b>	One of the mandatory elements of a food label, in which all the ingredients of the food are listed in descending order.
<b>health claim</b>	Statement on a food label indicating that consumption of an ingredient it contains is advantageous for health.
<b>nutrition claim</b>	Statement on a food label indicating the presence of a nutrient, usually for health purposes.
<b>discount</b>	Reduction in price.
<b>reputable supplier</b>	Shop, supermarket or food seller which has a good reputation for the quality and safety of the food on offer.
<b>low-risk foods</b>	Foods which have a long shelf life and don't pose a high risk of food poisoning.

## Preparing and cooking food

<b>Campylobacter</b>	The most common cause of food poisoning in the poultry.
<b>Salmonella</b>	The most common cause of hospital admissions in the UK, typically associated with raw eggs.
<b>E. coli</b>	Bacteria species naturally occurring in the human gut, which can be harmful if eaten.
<b>Listeria</b>	One of the most common reasons for food poisoning is drinking unpasteurised milk.
<b>Staphylococcus aureus</b>	Bacterium commonly found on the skin, which can cause food poisoning when eaten.
<b>high-risk foods</b>	Food products which offer the best conditions for increasing the risk of food poisoning, which include ready-to-eat products.
<b>eggs</b>	Perishable food product usually associated with food poisoning, one which should not be eaten after the best before date.
<b>hairnet</b>	Item of clothing used to prevent hair from falling into food.
<b>apron</b>	Item of clothing used to protect the cook's clothes from damage caused by oil splattering.
<b>direct contamination</b>	When a poisonous agent, pathogen or food particle is transferred from one food to another by touching it, having contact with it or being inhaled.
<b>indirect contamination</b>	When a poisonous agent, pathogen or food particle is transferred from one food to another via polluted hands, tools, utensils or other carriers.
<b>cross-contamination</b>	Transfer of microorganisms or food particles to a new food item to cause food poisoning or anaphylactic shock.
<b>disinfection</b>	Process in which microorganisms are killed, usually using high temperatures or antibacterial sprays.
<b>spores</b>	Form of bacteria or fungi resistant to high or low temperatures, which can multiply and reproduce in more friendly conditions.
<b>high-risk foods</b>	Food products which offer the best conditions for increasing the risk of food poisoning or food allergies.
<b>personal hygiene</b>	Habits and actions taken by individuals in order to prevent contamination or poisoning.
<b>core temperature</b>	The number of degrees Celsius or Fahrenheit in the centre of a food product.
<b>food safety</b>	All the actions and procedures taken to ensure that food is safe to eat.
<b>food probe</b>	Electronic tool used to measure the temperature of a food product.
<b>pathogenic bacteria</b>	Harmful bacteria that cause diseases and poisoning.
<b>dormant</b>	State in which microorganisms' bodily functions are inactive, activity is minimised in order to survive unfriendly conditions, low temperatures and allow for later growth.
<b>toxin</b>	Harmful substance released by microorganisms, which can be usually bitter in taste, which causes poisoning.
<b>allergens</b>	Substances or ingredients present in a food which can cause a danger to someone who is especially sensitive to them.
