Teacher's Introduction

Overview

This resource has been produced to support teaching and learning of the **WJEC GCSE Food Preparation and Nutrition** specification. The learning content is covered by the following sets of keywords with reference to the Learning Aims for the following topics:

- Macronutrients: proteins
- Macronutrients: fats, oils and lipids
- Macronutrients: carbohydrates
- Micronutrients: vitamins
- Micronutrients: minerals and water
- Energy requirements of individuals
- Balanced diet and guidelines
- Dietary needs and health
- Lifestyles and religions
- Calculate energy and nutritional values of recipes, meals and diets
- Reasons why food is cooked
- Heat transfer and cooking methods
- Position of microorganisms in dairy products
- Functional and chemical properties of ingredients
- Buying and storing food
- Preparing and cooking
- Microorganisms, enzymes
- Bacterial contamination
- Food origins
- Food miles, packaging
- Food security
- Culinary traditions and cuisines
- Foods in Wales
- Food production
- Technology and food
- Sensory perception
- Factors which influence food choices
- Food choices
- Food labelling and nutrition

For each set, there are a number of different keyword activities on CD designed to give variety in the classroom, homework and revision. This variety enables you to take a different approach to the Crosswords as homework for one topic, and the Match Up as a starter for another.

Alternatively, differentiate the activity for a given topic; for example, you might want to use the **Crosswords** early on while you start weaker learners on the **Match Up** (where terms are matched to definitions). The **Domino** and **Bingo** activities add an element of fun and reinforcement, as well as potentially making the **Flash Cards** come into their own for revision and the **Table Fill** and **Write Your Own** activities to test understanding by correctly filling in keywords or definitions.

For more information about the different activities included, see overleaf →

Digital Format!

All of the activities are provided electronically on the accompanying CD. To use on a school network, the entire contents of the CD needs to be copied and pasted into an accessible location.

Providing easy access to the activities are two HTML menus:

1. Access All Menu

Location: <index.html>

This menu, designed primarily for teacher use, includes links to everything on provided on the CD – allowing you to easily select what you need when preparing your lessons.

If you intend to give learners access to this menu, then be aware that it does include links to the solutions.

2. Interactive Crossword Menu

Location: <interactive-crosswords/index.html>

This menu, which can be accessed via the **Access All** Menu, provides the learner access to just the interactive crosswords (without the answers).

Free Updates!

Register your email address to receive any future free updates* made to this resource or other Food Preparation and Nutrition resources your school has purchased, and details of any promotions for your subject.

* resulting from minor specification changes, suggestions from teachers and peer reviews, or occasional errors reported by customers

[Go to zzed.uk/freeupdates](http://zzed.uk/freeupdates)

Activity Types

All activities are provided as PDF files, allowing for easy printing and sharing on VLE. In addition, each of the single-page activities (*crosswords*, *match up* and *dominoes*) are provided on paper too.

The activities included in this resource are as follows:

Bingo

Each student is given a different bingo card containing a selection of words from the topic. The teacher reads the definitions using the Keyword Answers and the student must mark the words on their card to complete rows, columns, and the full bingo card.

Crosswords

These traditional keyword activities are especially effective as lesson or homework – and are also an excellent way to bring students into their revision programme.

In addition to the photocopiable worksheets and pdf, the crossword activities are also available in a web-based format on the accompanying CD-ROM. These are web-based (HTML) and can be accessed through your Internet browser.

Dominoes

This is essentially another match-up activity, but this one is designed to be used to engage students. It is recommended that students work in pairs or small groups.

Half of each card contains a keyword, and the other contains a description. To complete the activity, students must align all the cards in the correct order. There is a 'Start' and a 'Finish', meaning if the chain is not complete outside of the chain, then students have gone wrong somewhere.

Match Up

Students match descriptions to their keyword by drawing lines between them. As there are similar descriptions and keywords, students are likely to make the occasional mistake. While completing the activity, so it is recommended that they use a pencil to start with. Once they are confident with the keywords that they are familiar with, students can then think about and learn the ones they are less confident with.

Flash Cards

These are a helpful revision tool. To make the cards, fold the page in half, then glue the edges together so the keyword is on one side and the definition the other. In addition to the cards, there are instructions on how to play a game of pairs. Cut each card in two and place face down on the table. Students will then take it in turns to turn over two cards with the aim of matching the keyword with the definition. Matched up cards are removed and the game is finished when all the cards have been matched.

Table Fill

Nothing fancy – students simply write the keyword which is being described, with no other help. Because this activity tests the students' own knowledge, it is best used as a homework activity at the end of each topic or during revision. This then acts as a good way to check the key terms for each topic. Alternatively, they could be given to students to see what they already know.

Write Your Own Glossary

Like the Table Fill, this activity can be used to test pupils before learning a topic or after learning a topic. Students are given a list of the keywords and need to provide definitions. Using Table Fill and Write Your Own Glossary, lessons can be differentiated to suit the needs of the class.

* **Preparation and cooking techniques** and **Developing recipes and meals** keywords, due to cross-over with other topics.

Macronutrients: proteins

Across

- 1 A by-product of extracting oil from soya beans, usually in the form of chunks. (8,9,7)
- 3 Traditional Japanese paste made of fermented soya, used for sauces and spreads. (4)
- 5 Soya, tofu and Quorn™ are examples of protein _____. (12)
- 6 Type of protein in which some of the essential amino acids are in low amounts or lacking; usually of plant origin. (3,10,5)
- 8 What happens to proteins when the molecules aggregate, e.g. as a reaction to heat. (7,4)
- 9 The process of combining rice and peas. (7,15)
- 11 Disease caused by protein deficiency. (11)
- 13 _____ amino acids can be built by the human body from available resources. (3-9)
- 14 Nitrogen-based molecules which build the peptide chains. (5,5)
- 15 A process that happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action. (12)

Down

- 2 Amino acids which can be used by the body from scratch to build a healthy diet. (10)
- 4 Soya and meat are both sources of protein. (4,10)
- 7 Protein-rich products from fungi. (11)
- 9 The main function of proteins is the repair of body tissues. (12)
- 10 Tiny, easy-to-digest proteins from South America, used as a source of protein and fibre, and used in food. (10)
- 12 The only plant which can fix nitrogen. (12)

Macronutrients: fats, oils and lipids

Across

- 1 The only animal-derived fat which is liquid at room temperature. (4,3)
- 5 Visible fat derived from pigs. (4)
- 7 The type of fat present in fish oil. (15)
- 9 Group of chemical substances which include fatty acids, triglycerides, waxes and sterols, and which are insoluble in water. (5)
- 10 Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients. (7)
- 14 An oily fish which is rich in omega-3 fatty acids and has bright pink flesh. (5)
- 15 The 'good' fraction of cholesterol (abbr). (3)
- 16 There are three chains of them in a fat molecule. (5,5)
- 18 Type of fat where only one double chemical bond is present in the fatty acid chain. (15,3)
- 20 The type of fat present in butter. (9)
- 22 Scientific name for fats and oils. (13)
- 23 Type 2 ____ is a disease in which high blood sugar levels may cause health complications. (8)

Down

- 2 When atoms of ____ solid. (8)
- 3 The 'bad' fraction of cholesterol (abbr). (3)
- 4 Fatty acids which are synthesized from scratch and are not found in a healthy diet. (9,5)
- 6 A mixture of oil and water. (5)
- 8 Connective tissue that stores energy, and insulates the body. (5)
- 11 Fats produced which are solid at room temperature. (5)
- 12 Fatty substances that are found in cell membranes and are used for energy storage. (5)
- 13 Type of fat present in butter. (9)
- 17 Measured in kilojoules per gram, the energy density of fats is found on food labels. (5)
- 19 An energy-dense nutrient that is stored in the body and three chains of fatty acids are found in it. (5)
- 21 Hard animal fat used to feed birds. (4)

Macronutrients: carbohydrates

Across

- 2** Flour which is made of whole grains. (9)
- 8** Type of carbohydrate built from two molecules of sugar, such as lactose and sucrose. (12)
- 9** Simple sugar which builds many complex carbohydrates. (7)
- 10** Tooth ____ may be an effect of eating too many sweets. (5)
- 11** Carbohydrates built from one molecule only, such as fructose and galactose. (15)
- 13** Type of soluble fibre, present in fruit and plants as a gelling agent. (6)
- 14** Carbohydrate ____ in potatoes and corn. (6)
- 15** Primary source of energy which should make up 50% of a balanced diet. (13)
- 17** ____ fibre swells in the stomach and increases the feeling of satiety. (7)

Down

- 1** Simple sugar naturally found in fruits. (5)
- 3** Disaccharide present in milk. (6)
- 4** Long carbohydrate chain. (10)
- 5** Sugars which naturally occur in fruits and honey. (9)
- 6** Polysaccharide found in plants. (10)
- 7** Carbohydrate which is not digestible. (5)
- 10** Substance occurs in the large intestine and is indigestible for human health. (7,5)
- 12** Cellulose and lignin. (10)
- 16** ____ sugar is added to many processed foods and should be limited. (6)

Micronutrients: vitamins

Across

- 4 ____ anaemia may be caused by lack of cobalamin. (10)
- 6 Symptoms of this disease caused by niacin deficiency include three Ds: diarrhoea, dermatitis and dementia. (8)
- 8 The chemical name for vitamin B1. (8)
- 10 Eyesight condition caused by vitamin A deficiency. (5,9)
- 13 The chemical name for a water-soluble vitamin which is crucial for releasing energy from foods (vitamin B2). (10)
- 14 In ____ bones become brittle and fragile. (12)
- 18 Beta-____ is the scientific name for the form of vitamin A present in carrots. (8)
- 19 ____ acid is the vitamin found in large amounts in fruit and vegetables. (8)
- 21 Scientific name for the form of vitamin A present in butter or liver. (7)

Down

- 1 Organic molecules, ____ body. (8)
- 2 A pill or capsule taken ____ body and improve ____
- 3 Scientific name for ____
- 5 Deficiency of this v ____
- 7 The chemical name ____ in milk, dairy products ____ skin. (15)
- 9 A group of people with ____ cobalamin deficiency
- 11 Disease caused by ____ include weakening ____
- 12 Condition caused by ____ period. (5,6)
- 15 Condition caused by ____
- 16 Childhood disease ____
- 17 ____ acid is the vitamin found in spinach. (5)
- 20 Vitamin D is produced ____

Micronutrients: minerals and water

Across

- 4 Non-haem ____ is found in plant foods such as spinach or broccoli. (4)
- 5 The hardest tissue in the human body. (6)
- 7 Condition in which the thyroid gland is enlarged. (6)
- 11 Brittle bone disease. (12)
- 13 ____ often affects the elderly on the hot, sunny days. (10)
- 15 Microelement necessary for regulating metabolism. (6)
- 17 Cheese, yoghurt or buttermilk. (5)
- 19 Process in which drinking water is enriched in fluoride. (7)
- 20 Chemical element found in milk, dairy products and oily fish, necessary for the proper development and growth of bones and teeth. (7)
- 21 Mineral which, with vitamin B6 is responsible for the proper muscle performance. (9)
- 22 Function of water whereby harmful substances are removed from the body. (12)

Down

- 1 Invertebrate marine protein and iodine.
- 2 Blood protein responsible for carrying oxygen.
- 3 Childhood disease caused by being deficient in vitamin D.
- 6 Salty secretion on the skin.
- 8 Inorganic chemical found in all cells, conduct electricity.
- 9 When not enough water is consumed.
- 10 One of the electrolytes responsible for nerve impulses. (9)
- 12 Condition caused by poor hygiene, where enamel is damaged by bacteria. (5,5)
- 14 Small gland in front of the thyroid necessary for proper metabolism.
- 16 Trace element necessary for the production of red blood cells.
- 18 Condition caused by a deficiency of particular iron, vitamin B12 and folic acid, leading to low red blood cell levels.

Energy requirements of individuals

Across

- 3 Nutrient provided in large amounts in wholemeal bread, other than fibre and group B vitamins. (12)
- 5 A ____ source of energy is food that is used mainly to provide energy. (7)
- 8 Unit used to measure energy, equals to 0.24 kilocalories. (9)
- 10 Milk to feed a baby is produced by the breasts in the process called _____. (9)
- 11 Bread and pasta are an important energy _____. (7)
- 12 The way in which a person lives and how active a person is, which significantly affects energy needs. (9)
- 13 Macromolecules present in a high concentration in nuts, seeds and fish. (4)
- 14 A ____ source of energy is food that is used to produce energy only if other resources are lacking. (9)
- 15 Macromolecules present in high concentrations in fish, meat and dairy products. (8)

Down

- 1 Situation in which energy expenditure are equal. (10)
- 2 Food which provides energy. (5,4)
- 4 Acronym for the energy balance. (3)
- 6 What happens to energy balance when energy expenditure is greater than energy intake – more energy is used than is taken in. (6,4)
- 7 A unit used to measure energy, equals to 4.18 kilocalories. (7)
- 9 Condition diagnosed when energy intake is less than energy expenditure. (10)
- 15 Acronym for the energy balance. (3)

Balanced diet and guidelines

Across

- 8** Chemical substances necessary for the proper functioning of the body, needed in small amounts only. (14)
- 9** A _____ for children is smaller than for adults. (7,4)
- 12** There are two types – soluble and insoluble – which help to reduce cholesterol and prevent constipation respectively. (5)
- 13** A person who doesn't eat enough is likely to be _____. (14)
- 14** Process of supplying a sufficient level of water in the body. (9)
- 17** Low-activity lifestyle. (9)
- 18** The maximum bone density, reached during adolescence and early adulthood, thanks to calcium accumulation. (4,4,4)

Down

- 1** Movement of the body. (8,8)
- 2** Period in which the body is growing. (6,5)
- 3** State in which excess fat and micromolecules are accumulated, leading to related health conditions. (5)
- 4** _____ include three groups of nutrients that the organism in large quantities. (5)
- 5** Sugar naturally occurring in fruits and vegetables. (5)
- 6** A person who doesn't eat enough. (5)
- 7** Sugars added to food and drinks, which are not naturally occurring, should be limited to remain below a certain level. (5)
- 10** _____-3 is an essential fatty acid found in oily fish. (5)
- 11** To stay healthy, one should follow a balanced diet. (5)
- 15** Food which provides energy. (5)
- 16** The British Nutrition Foundation recommends that adults should provide less than a certain amount of energy. (5)

Dietary needs and health

Across

- 2** Ratio of body mass to height squared (kg/m^2), used to assess whether someone's weight is optimal for their height. (4,4,5)
- 12** Also known as a 'brain attack'. This is often caused by a diet high in saturated fats. (6)
- 13** Condition (usually acquired) in which milk sugar cannot be digested properly, causing bloating, stomach ache and diarrhoea. (7,11)
- 14** Vessels which pump blood to the heart. (8,8)
- 18** The medical term for blood sugar level. (9)
- 20** Protein in cereals that may cause digestive problems or an autoimmune reaction. (6)
- 21** Condition caused by iron deficiency, an inability to properly ingest it. (4,10,7)

Down

- 1** Mammary gland tumour, often associated with obesity, drinking alcohol and hormonal issues. (5)
- 3** Condition in which cholesterol builds up in the arteries, narrowing the vessels. (15)
- 4** Condition in which the body is unable to absorb and use calcium properly. (5)
- 5** Childhood disease caused by a deficiency in vitamin D. (5)
- 6** The risk of ___ can be reduced by eating enough fibre. (5)
- 7** High blood pressure. (5)
- 8** A person who suffers from a chronic condition. (5)
- 9** A disease that is characterized by a chronic inflammation of the gut, often due to a lack of certain nutrients. (5)
- 10** ___ heart disease caused by a build-up of plaque in the arteries. (5)
- 11** Ability to protect the body from infection. (5)
- 15** State in which a lot of people are affected by a condition. (7)
- 16** Symptoms of an ___ condition, such as difficulty breathing, chest pain, and coughing. (5)
- 17** Hormone which lowers blood sugar levels. (5)
- 18** Simple sugar present in many foods. (5)
- 19** Person who cannot digest certain foods due to an autoimmune reaction. (7)

Lifestyles and religions

Across

- 3** Pork is not considered a ____ meat in Islam. (5)
- 7** Many ____ celebrate Rosh Hashanah by cooking special foods. (4)
- 8** Group of people who do not eat meat, but eat eggs and dairy products. (5-3-11)
- 10** Type of diet which does not allow consumption of meat, and sometimes other animal-derived foods such as fish, milk or eggs. (10)
- 11** Idea, trust or confidence in something, relating to religion, ethics or morality, which can affect people's food choices in a significant way. (6)
- 12** System of beliefs and values which affect human's lives, from their lifestyle to their food choices. (8)

Down

- 1** A person who does not eat meat. (5)
- 2** During Ramadan, Muslims fast from sunrise to sunset. (7)
- 4** Group of people who do not eat meat, but eat dairy products. (5)
- 5** Pork chops and bacon are not considered halal food in Islam. (5)
- 6** Holi and Diwali are festivals celebrated in India. (6)
- 9** Beef and lamb are not considered halal food in Islam. (6)

Reasons why food is cooked

Across

- 3 Cooking pork for a long time at a low temperature helps to ____ the meat. (9)
- 7 Food which is particularly mouth-watering and appealing. (10)
- 8 Cooking can affect the ____ of meat thanks to multiple chemical reactions, such as caramelisation and denaturation. (7)
- 9 Roof of the mouth. (6)
- 11 Solanine is an example of a natural ____ occurring in green potatoes. (6)
- 12 Cooking helps to improve it by making food easier to chew. (7)

Down

- 1 Salmonella is typically a cause of food poisoning if you eat it. (10)
- 2 Food which is seen as a delicacy is called _____. (4)
- 4 Process of breaking down food in the stomach and intestines into small pieces that can pass through the gut wall. (10)
- 5 Food which is in a state of being cooked or treated or processed. (10)
- 6 How long a food has been cooked for. (4)
- 10 Can't be smelled. (4)

Heat transfer and cooking methods

Across

- 3** Cooking method in which food is immersed in large amounts of hot oil. (4-6)
- 5** When various preparation and cooking methods cause a decrease in the nutritional value of a food product. (7,4)
- 8** Electromagnetic waves used in radio transmissions or cooking. (10)
- 11** Cooking method which helps to preserve the nutrient levels in food. (8)
- 13** The effect on food of exposure to air. (9)
- 16** Fat-based cooking method that originated in Asia and the requires the use of a wok and a small amount of oil or sauce. (4-3)
- 17** The process in which vegetables are put into boiling water for a short time, then quickly dipped into ice-cold water. (9)
- 18** Barbecuing – cooking food on a special grid, usually in an oven or over an open fire. (8)
- 19** The effect on fruit of enzyme action. (8)
- 21** Food which is cooked below boiling point for a long time is _____. (8)
- 22** Baking and toasting are examples of using _____ in cooking. (3,4)

Down

- 1** Cooking method in which food is stewed. (8)
- 2** _____ transfers heat. (10)
- 4** _____ needs a medium to travel. (10)
- 6** Type of wave emitted by the sun. (10)
- 7** Fat-based cooking method that uses fat to transfer the heat. (10)
- 9** In _____, heat waves are reflected. (10)
- 10** Moist cooking method that involves cooking food at 100 degrees Celsius in a liquid, which softens its texture. (8)
- 12** Moist cooking method that involves cooking food in water at 100 degrees Celsius. (10)
- 14** Mixture of oil, acid, and spices. (10)
- 15** Dry cooking method that involves exposing food to the heat of the oven. (10)
- 20** Traditional Sunday dinner. (10)

Buying and storing food

Across

- 4 Temperature between 20 and 25 degrees Celsius, at which some foods can be safely stored. (7)
- 5 Refrigerators are used to store ____ foods. (7)
- 7 Freezer ____ happens to improperly frozen or insecurely wrapped frozen foods. (4)
- 8 Changing the physical state due to increase in temperature. (7)
- 9 ____ food increases the possibility of food poisoning. (4-4)
- 10 Perishable food product usually associated with food poisoning – the only one which should not be eaten after the best before date. (7)
- 12 ____ temperatures increase the risk of bacterial growth. (6,4)

Down

- 1 How long a food can be stored. (7)
- 2 Storing food at temperature in order to stop bacterial growth and maintain nutritional value. (7)
- 3 Strong cheese and other foods that can be contaminated by other foods. (7)
- 6 Another name for food poisoning. (7)
- 7 Date mark on dry goods. (7)
- 11 Date mark on fresh foods. (7)

Preparing and cooking food

Across

- 1 A food probe is used to measure the ____ temperature of a dish. (4)
- 2 Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning or food allergy. (4-4,5)
- 5 Item of clothing placed on a cook's head. (7)
- 8 Electronic tool inserted into food to check its readiness. (5)
- 9 Killing bacteria with heat or special sprays. (12)
- 11 Protects clothes from stains and dirt. (6)
- 12 Made of latex or vinyl. (6)
- 13 Bacteria which cause food poisoning. (9)

Down

- 1 Cross-____ is a type of food to another.
- 3 Survival form of bacteria.
- 4 State in which microorganisms are slowed down and can survive unfriendly conditions at low temperatures and low moisture.
- 6 Personal ____ rule about not touching one's face.
- 7 Harmful substance that can cause food poisoning.
- 10 All the actions and procedures that ensure food is not harmful to health.

Microorganisms, enzymes and food spoilage

Across

- 2 Single-celled fungus used in beer production. (5)
 5 Biologically active, protein-based molecule which speeds up chemical reactions. (6)
 9 A process which turns milk into yoghurt. (12)
 11 Illness caused by microorganisms or toxins. (9)
 12 One of the products of yeast action. (7)
 14 The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in flavour or smell. (9)
 16 Bacteria which need oxygen. (7)
 19 ___ kills all bacteria and spores. (12)
 20 Microscopic organisms found everywhere in the environment, on human body and in food, which can cause food spoilage. (14)
 21 Cooking method which stops darkening of fruit and vegetables. (9)
 22 Disease-causing bacteria. (9)

Down

- 1 Darkening of fruit and vegetables. (8)
 3 Form of bacteria or fungi which grows at high temperatures which are not friendly conditions. (10)
 4 ___ is a process in which food is preserved by the action of heat. (10)
 6 Chemical reaction between an acid and an alkali. (10)
 7 ___ of food with bacteria. (10)
 8 Food products which are contaminated by microorganisms grow and cause food poisoning, which is dangerous to eat products. (4-10)
 10 Furry growth on bread. (10)
 13 Negative change in the number of microorganisms in a sample. (10)
 15 Bacteria which do not need oxygen. (10)
 17 20 to 40 degrees Celsius is the ideal temperature for bacterial growth. (7)
 18 Microscopic organisms which are used in the production of yoghurt, which can cause food poisoning. (8)

Bacterial contamination

Across

- 4** Process in which microorganisms are killed, usually with the use of high temperatures or antibacterial sprays. (12)
- 5** Bacteria species found in offal and poultry. (13)
- 8** One of the main symptoms of food poisoning, usually preceded by nausea. (8)
- 12** ___ foods are usually moist and protein-rich, and need to be refrigerated to decrease the risk of food poisoning. (10)
- 13** One of the main symptoms of food poisoning, characterised by increased bowel movements and pain. (9)
- 15** Bacteria which cause diseases. (9)
- 16** Bacterium commonly found on the skin, which produces toxins and causes food poisoning when eaten. (14,6)
- 17** Method of food packaging in which all the air is sucked out of the package before sealing, which prevents oxidation and prolongs shelf life. (6,7)

Down

- 1** Method of preservation using salt or vinegar solution. (10)
- 2** Cross-___ of food. (13)
- 3** Manifestation of food poisoning. (8)
- 6** Person or animal that has been infected but is not yet showing symptoms. (10)
- 7** One of the main symptoms of food poisoning, known as dyspepsia. (8)
- 9** Condition caused by the development of pathogens in food. (4,9)
- 10** This kind of milk is made from raw milk. (10)
- 11** Bacteria species found in soil. (10)
- 14** Bacteria species found in the intestines but which can cause food poisoning. (10)
- 15** Insects or other animals that can contaminate crops or food supplies. (10)

Macronutrients: proteins (Match Up)

1	A by-product of extracting oil from soya beans, usually in the form of chunks.
2	A process that happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
3	Amino acids which can be built by the human body from available resources.
4	Amino acids which cannot be produced by the human body from scratch and have to be provided in a healthy diet.
5	Combining two or more low biological value proteins in order to produce a high biological value protein.
6	Condition caused by prolonged deficiency of protein, occurring especially in developing countries and is characterised by swelling of the stomach.
7	Long chains of amino acids that are the building blocks of the body, support growth and development. They make up 15% of a balanced diet.
8	Nitrogen-based molecules that bind together to form a chain of peptides.
9	Protein-rich product made by <i>Fusarium venenatum</i> fungi.
10	Protein-rich products made without the use of animal-derived ingredients.
11	Tiny, easy-to-digest, gluten-free grains originating from South America, rich in carbohydrates, protein, fibre, and used as a protein alternative.
12	Traditional Japanese paste made of fermented soya, used for sauces and spreads.
13	Type of bean rich in high biological value protein, used for manufacturing many other products, such as oil, sauce or cheese-like products.
14	Type of protein in which all essential amino acids are present in the correct amounts; usually of animal origin.
15	Type of protein in which some of the essential amino acids are in low amounts or lacking; usually of plant origin.
16	What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.

Macronutrients: fats, oils and lipids (Match Up)

1	A mixture of oil and water.
2	An energy-dense macromolecule built from glycerol and three chains of acids, necessary for building hormones and insulating the body.
3	An oily fish which is rich in essential fatty acids, characterised by its pink flesh.
4	Chronic disease characterised by high blood sugar levels, often developing as a result of high fat obesity.
5	Condition in which abnormally high levels of adipose tissue are stored in the body, usually cause excessive intake of macronutrients.
6	Connective tissue whose main function is to store energy, and insulate and cushion organs.
7	Fatty acids which cannot be built by the human body from scratch and have to be provided as a part of a healthy diet.
8	Fatty substance necessary for building cell membranes and bile in the gall bladder.
9	Group of chemical substances which include fatty acids, triglycerides, waxes and sterols, and which are insoluble in water.
10	High-density fraction of cholesterol which transports fats from the blood to the liver, and lowers cholesterol levels.
11	Low-density fraction of cholesterol which transports fats around the body and to the cells.
12	The chemical name for a fat molecule.
13	The density or amount of calories derived from a given food, measured in kilojoules or kilocalories.
14	The only animal-derived fat which is liquid at room temperature.
15	The process of adding hydrogen atoms to a triglyceride to change its texture from liquid to solid.
16	Three long hydrocarbon chains attached to a glycerol particle to form a molecule of fat.
17	Type of fat in which all the chemical bonds are single.
18	Type of fat in which one or more double chemical bonds are present.
19	Type of fat where more than one double chemical bond is present in the fatty acid chain.
20	Type of fat where only one double chemical bond is present in the fatty acid chain.
21	Type of fats which are produced as a result of heating oils to high temperatures for a long time.
22	Visible fat derived from pigs.
23	Visible fat surrounding the loins and kidneys of cows and sheep, high in saturated fats and characteristic of traditional British cuisine.

Macronutrients: carbohydrates *(Match Up)*

1	A simple sugar built from five atoms of carbon, naturally occurring in fruit.
2	Carbohydrate which is built from large numbers of molecules bound together into long chains.
3	Carbohydrates built from one molecule only.
4	Carbohydrates built from two particles of sugars, examples of which are lactose and sucrose.
5	Condition in which enamel is damaged by bacteria, causing pain and trouble eating.
6	Disaccharide present in milk.
7	Flour made from whole grains, without separating the bran.
8	Large organic macromolecules produced by plants during photosynthesis, and which include sugars and fibre.
9	Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.
10	Organic macromolecules produced by plants, bound into long chains in order to store energy for later use.
11	Polysaccharide stored in the liver and muscle cells which is an emergency source of energy.
12	Simple sugar which is a basic source of energy for all of the cells around the human body.
13	Substance occurring in plant cells only, usually indigestible for humans but necessary for maintenance of plant structure.
14	Sugars added to food products, as opposed to those naturally occurring in foods.
15	Sugars that occur naturally in food products, as opposed to free sugars.
16	Type of fibre which absorbs water and enhances bowel movements, usually in the form of cellulose.
17	Type of fibre which swells in the stomach giving the feeling of satiety, usually in the form of pectin.
18	Type of soluble fibre, present in fruit, which acts as a gelling agent.

Micronutrients: vitamins (Match Up)

1	A group of people whose dietary restrictions may lead to cobalamin deficiency.
2	A pill or capsule taken to top up micronutrient levels in the body and improve overall health.
3	Childhood disease caused by an imbalanced, micronutrient-deficient diet.
4	Condition caused by folate deficiency during the prenatal period.
5	Condition in which bones lose their density and become fragile and easy to break.
6	Disease caused by niacin deficiency, characterised by sensitivity to sunlight.
7	Disease caused by thiamine deficiency, symptoms of which include weakening of the muscles leading to paralysis.
8	Disease caused by vitamin C deficiency, the main symptoms of which include receding and bleeding gums and tooth loss.
9	Eyesight condition caused by vitamin A deficiency.
10	Form of vitamin A found in animal-derived foods.
11	Form of vitamin A found in fruit and vegetables.
12	Organic molecules needed in very small amounts, usually provided by the diet but some can also be synthesised in the body.
13	The chemical name for a water-soluble vitamin which is crucial for releasing energy from foods.
14	The chemical name for vitamin B1, deficiency of which causes beriberi disease.
15	The chemical name for vitamin B12, found mainly in meat, offal and egg yolk.
16	The chemical name for vitamin B3, necessary for releasing energy from food, found in lean meat, poultry and fish.
17	The chemical name for vitamin B9, crucial for proper development of the spinal cord and for the production of red blood cells.
18	The chemical name for vitamin C, found mainly in fruit and vegetables, such as potatoes, blueberries and citrus fruits.
19	The chemical name for vitamin D, present in large amounts in milk, dairy products and oily fish, and produced in the skin.
20	The organ which produces cholecalciferol in reaction to exposure to sunlight.
21	Type of anaemia caused by vitamin B12 deficiency, as opposed to iron deficiency anaemia.

Micronutrients: minerals and water (Match Up)

1	Chemical element found in milk, dairy products and bony fish, necessary for the proper development of bones and teeth.
2	Chemical trace element necessary for the proper development of tooth enamel.
3	Childhood disease caused by an imbalanced diet which is deficient in vitamin D and calcium.
4	Condition caused by a deficiency of micronutrients, in particular iron, vitamin B12 and folate, characterised by low red blood cell levels.
5	Condition caused by improper fluoride intake and bad mouth hygiene, where enamel becomes discoloured and bacteria.
6	Condition caused by iodine deficiency, symptoms of which include swelling of the neck and characterised by a goitre.
7	Condition in adults in which bones lose their density and become fragile and easy to break.
8	Element necessary for building red blood cells, which is easily ingested from meat and eggs but is harder to ingest from plant-derived foods.
9	Function of water whereby harmful substances are removed from the body.
10	Important electrolyte necessary for conducting electrical impulses in the nerves and for lowering blood pressure.
11	Inorganic chemical element necessary for the body to build cells, conduct electric impulses or build bones.
12	Invertebrate marine organisms used as food which is rich in protein and iodine.
13	Liquid, salty secretion from glands located mainly in the armpits and from skin pores all over the body.
14	Mineral necessary for the proper performance of the nervous system, preventing involuntary muscle contractions and keeping the heartbeat steady.
15	Process in which drinking water is enriched in fluoride.
16	Products made from milk, often high in calcium.
17	Red pigment in blood cells, built from four peptide chains attached to iron atoms, responsible for carrying oxygen in the body.
18	Serious condition in which the body cannot cool down any more and gets so hot that it becomes life-threatening, e.g. as the result of very hot weather.
19	Small gland in front of the neck which produces hormones necessary for proper metabolism.
20	State caused by excessive loss and insufficient replenishment of water, usually as the result of excessive sweating or exaggerated physical activity.
21	The hardest tissue in the human body, which forms the external part of the teeth.
22	Trace element necessary for building thyroid hormones which regulate the rate of metabolism in the body.

Energy requirements of individuals (Match Up)

1	A method of expressing an individual's physical activity as a number, used to indicate the amount required for activities such as running, walking and sleeping.
2	Amount of energy necessary for conducting basic life functions, such as breathing or heartbeat.
3	Condition in which abnormally high levels of adipose tissue are stored in the body, usually cause excessive intake of macronutrients.
4	Easily available source of energy which is used as a first resort.
5	Food rich in certain macromolecules, such as carbohydrates or fats, which is consumed mainly to provide power.
6	Food which provides many calories in one gram.
7	Group of macronutrients which should constitute around 15% of daily calorie intake.
8	Group of macronutrients which should provide around 50% of daily energy intake, usually along with vitamins and dietary fibre.
9	Process and period of time during which mammary glands produce milk to feed a baby.
10	Situation in which energy consumption and expenditure are equal.
11	Source of energy which is used only if other resources are unavailable.
12	The way in which a person lives and how active a person is, which significantly affects energy needs.
13	Triglycerides – energy-dense macromolecules present in a range of foods, which should provide a certain daily calorie intake.
14	Unit used to measure energy, equals to 0.24 kilocalories.
15	Unit used to measure energy, which equals approximately 4,184 joules.
16	What happens to the body when the energy balance is negative – more energy is burnt than is provided in the diet.

INSPECTION COPY

PROTECTED**

Balanced diet and guidelines (Match Up)

1	Amount of food eaten in one meal, usually differing depending on a person's age, sex and body size.
2	Chemical substances necessary for building the body and providing energy, needed in large amounts.
3	Chemical substances necessary for the proper functioning of the body, needed in small amounts.
4	Consumption of this type of sugar should be limited to less than 5% of daily calorie intake.
5	Essential fatty acids, present in large amounts in fish, with double bonds located at the third carbon from the end of the fatty acid chain.
6	Food which provides many calories in one gram.
7	Habits and behaviours which include little or no physical activity.
8	Movement of the body which requires energy expenditure.
9	Period in which the body grows rapidly, i.e. in early childhood and during adolescence.
10	Process of supplying a sufficient level of water in the body.
11	Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts to allow proper functioning of the human body.
12	State in which excessive amounts of macro- or micromolecules are provided, which may lead to related health conditions.
13	State in which insufficient amounts of macro- and micronutrients are provided.
14	State in which insufficient macro- and micronutrients are provided, often leading to weight loss caused by nutrient deficiency.
15	Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and thus the risk of bowel cancer.
16	Sugars added to food products, as opposed to those naturally occurring in foods, consumption of which should be limited to remain healthy.
17	Sugars naturally occurring in food products, as opposed to free sugars.
18	The maximum bone density, reached during adolescence and early adulthood, thanks to calcium intake.

Dietary needs and health (Match Up)

1	Abnormally high blood pressure, characteristic of cardiovascular diseases.
2	Childhood disease caused by an imbalanced diet which is deficient in vitamin D and calcium.
3	Chronic disease caused by insufficient performance of insulin, in which abnormally high blood sugar levels occur.
4	Condition (usually acquired) in which milk sugar cannot be digested properly, causing bloating, gas and diarrhoea.
5	Condition caused by iron deficiency or an inability to properly ingest it.
6	Condition in which abnormally high levels of adipose tissue are stored in the body, usually causing excessive intake of macronutrients.
7	Condition in which bones lose their density and become fragile and easy to break.
8	Condition in which crystals accumulate in joints, causing swelling, pain and difficulty walking, or an effect of unhealthy diet and obesity.
9	Condition in which heart blood vessels are narrowed by the accumulation of cholesterol plaque leading to heart attack.
10	Condition in which veins and arteries are narrowed due to cholesterol plaque accumulation.
11	Disease characterised by immune reaction to gluten, leading to damage of the villi in the intestine and nutrient malabsorption.
12	Glycaemia, or the amount of glucose present in the blood.
13	Important hormone, produced in the pancreas, which is responsible for lowering blood sugar levels.
14	Mammary gland tumour, for which risk factors include obesity, drinking alcohol and lack of exercise, as well as hormonal issues and gene mutations.
15	Overreaction of the immune system to a food product, which makes it one of the most important factors in planning a diet.
16	Protein which is present in some cereals, such as wheat, rye or barley, and which cannot be eaten by people with coeliac disease.
17	Ratio of body mass to height squared (kg/m^2), used to assess whether someone's weight is optimal for their height.
18	Simple sugar which is a basic source of energy for all of the cells around the human body.
19	State in which blood is not provided to the brain or massive bleeding occurs in the brain, causing death to the brain cells.
20	The blood vessels which pump blood to the heart.
21	The body's defence system, protecting it from infections and fighting off bacteria and viruses.
22	Tumour of the lower digestive tract, for which risk factors include low consumption of dietary fibre and an unhealthy diet.

Lifestyles and religions (Match Up)

1	Food prepared following the rules of the Jewish food law called kashrut.
2	Food products which are forbidden for consumption in Islam, such as pork and alcohol.
3	Group of people who do not eat meat or eggs, but eat dairy products.
4	Group of people who do not eat meat, but eat eggs and dairy products.
5	Idea, trust or confidence in something, relating to religion, ethics or morality, which can affect choices in a significant way.
6	Meat from animals killed in a ritual way or other food products permitted for consumption by Muslims.
7	Person who follows the rules of a religion originating in India.
8	Person who follows the rules of Islam, a religion established in the seventh century by Muhammad.
9	Person who follows the rules of Judaism, a religion originating in Israel.
10	System of beliefs and laws which affect human's lives, from their lifestyle to their food choices.
11	Type of diet which does not allow consumption of any animal-derived food products.
12	Type of diet which does not allow consumption of meat, and sometimes other animal-derived food products, such as fish, milk or eggs.

Calculate energy and nutritional values of recipes, meals and diets (Match)

1	Amount of macro- and micronutrients present in a given food, ingredient or meal.
2	Chemical substances necessary for building the body and providing energy, needed in large amounts
3	Chemical substances necessary for the proper functioning of the body, needed in small amounts
4	Digestible polysaccharide present in rice, bread or pasta, built from long chains of glucose particles together.
5	Organic macromolecules produced by plants during photosynthesis, present in a range of food products in form of single or paired molecules.
6	Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts from various sources.
7	State in which sufficient, appropriate amounts of nutrients and water are provided.
8	Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and thus the risk of bowel cancer.
9	Table which shows detailed nutritional information about food products and ingredients.
10	Type of fats in which all the chemical bonds are single, present in large amounts in lard or butter
11	Type of freshwater and saltwater fish in which fats are present in large amounts and distributed throughout their body.
12	Type of notes or calendar in which all foods eaten during a certain period of time are written in order to assess one's diet or eating habits.

Reasons why food is cooked (Match Up)

1	All actions and procedures taken to ensure that food is not harmful and is secure to eat.
2	Appealing – stimulating craving for a particular food product.
3	Durability – the amount of time during which a food can be safely stored and eaten.
4	Food which is in its natural state, before any heat treatment or processing.
5	Process of breaking down nutrients in the stomach and intestines into a form which can be ingested into the bloodstream.
6	Process of softening and improving the texture of meat and poultry by slow-cooking, cutting it in half using a marinade or a mallet.
7	Term that refers to whether food is pleasurable and agreeable to the palate.
8	The combined sensation of taste, smell and mouthfeel, which can be greatly altered and improved by cooking.
9	The consistency of a food product, usually created or altered during cooking.
10	The smell of food, usually more prominent in hot foods than in cold ones.
11	Tiny, omnipresent microorganisms which can cause food poisoning if a food is uncooked or improperly cooked.
12	Toxic substances naturally present in foods, which can be deactivated or neutralised during cooking.

Heat transfer and cooking methods *(Match Up)*

1	Barbecuing – cooking food on a special grid, usually in an oven or over an open fire.
2	Dry cooking method in which food is first sealed in fat and then stewed for a long time.
3	Dry cooking method that involves using an oven without exposing food to the flame.
4	Dry cooking method that uses a small amount of fat/oil to prevent foods from drying out.
5	Electromagnetic waves used in radars, radio transmissions or cooking, which quickly heat up water.
6	Fat-based cooking method in which food is sunk in a large amount of oil.
7	Fat-based cooking method that originated in Asia and that requires the use of a wok and a small amount of oil or sauce.
8	Fat-based cooking method which requires a small amount of fat to transfer the heat and seal the food.
9	Method of transferring thermal energy between two objects without the use of water or oil.
10	Mixture of oil, acid, herbs and flavourings used to flavour and tenderise meat.
11	Moist cooking method in which food is kept below boiling point (85–99 degrees Celsius) for a long time.
12	Moist cooking method in which food is simmered below 85 degrees Celsius in a small amount of liquid in order to keep its texture.
13	Moist cooking method in which water vapour/steam is used to cook products that are placed above the liquid.
14	Moist cooking method where a large amount of bubbling water at 100 degrees Celsius is used.
15	Process in which heat is transferred directly to the food via vibration of the pan's molecules.
16	Process in which heat is transferred to food indirectly by sending heat waves to it.
17	Process in which heat is transferred to food indirectly through water or oil, or another medium.
18	The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
19	The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in taste or smell.
20	The process in which vegetables are put into boiling water for a short time and then quickly dipped into cold water.
21	The process in which vegetables are put into boiling water for a short time and then quickly dipped into cold water.
22	Type of invisible radiation emitted by every living organism, used in grills and ovens to transfer heat to food.
23	When various preparation and cooking methods cause a decrease in the nutritional value of a food.

Positive use of microorganisms in dairy products (Match Up)

1	Alcoholic beverage made from apple juice fermented with yeast.
2	Bacteria used in cheese production, added to begin the process of milk fermentation.
3	Coagulated milk – one of the steps of cheese production.
4	Enzyme used to coagulate milk in cheese production.
5	Fermented, cured and smoked spicy sausage originating from Spain.
6	Harmless bacteria used in food manufacturing.
7	Invisible and odourless gas produced in sugar fermentation, which helps to obtain fizzy beverage dough to rise.
8	Milky liquid – a by-product of cheese production, drained from the cheese and used as a beverage feed.
9	One of the products of yeast fermentation, used in beer and wine production.
10	Popular alcoholic beverage typically made from grapes fermented with yeast.
11	Process in which sugar is turned into another substance, used in yoghurt and cheese production
12	Product of milk fermentation with the use of probiotic bacteria.
13	Single-celled fungus used as leavening agent in the manufacturing of bread.
14	Spicy sausage originating from Italy, made of fermented beef or pork.
15	Sugar which occurs naturally in milk.
16	Traditional British cheese made with the use of mould.
17	Traditional French cheese made with the use of mould, with a characteristic white skin.
18	What lactose is turned into during bacterial fermentation.

INSPECTION COPY

Functional and chemical properties of ingredients *(Match Up)*

1	A solution of acid, oil, herbs and spices, used to prepare a range of meats and tenderise them.
2	Ability of fats to change their physical state at various temperatures, as well as to be easily spread and reshaped.
3	Branched polysaccharide – one of the compounds which build the chains of starch.
4	Denaturation of milk proteins in reaction to acid or enzymes, used in cheese production.
5	Light, delicate structure in which air bubbles are trapped in a liquid.
6	Long-chained carbohydrate present in potatoes, rice and pasta, built from amylose and amylopectin.
7	Molecule which is repelled by water molecules and doesn't mix easily with it.
8	One of the proteins present in flour, which, in presence of water, creates gluten.
9	One of the proteins present in flour, which, in the presence of water, creates gluten.
10	Process in which air bubbles are trapped in a mixture of fat, leading to cream formation.
11	Process in which fat molecules surround starch and prevent gluten formation, causing pastry to be flaky.
12	Process of mixing oil and water together to obtain a stable mixture, used to prepare mayonnaise.
13	Protein formed when flour is mixed with water, which builds a springy, elastic net and traps air to form the mixture.
14	Reaction of starch to dry heating, in which long chains of starch break down into shorter ones, causing a slight sweet flavour.
15	Reaction of starch to water and heating, in which starch granules swell and break up, used to thicken soups or cook a risotto.
16	Temperature at which fat transforms into oil.
17	The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
18	The effect on food of exposure to air, leading to decrease in nutritional value as well as a change in smell.
19	The process of separating water from overcooked, overcoagulated proteins, e.g. in eggs.
20	Unbranched polysaccharide – one of the compounds which build the chains of starch.
21	What happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action?
22	What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.

Buying and storing food (Match Up)

1	A condition that occurs to frozen foods if they are not covered properly and air reaches them, causing oxidation and dehydration.
2	Date mark which applies to food quality, usually used for dry foods such as biscuits or pasta.
3	Date mark which applies to food safety, after which the food cannot be eaten any more; usually for unprocessed foods.
4	Defrosting – changing the physical state of food from solid and hard to soft or liquid, caused by a change in temperature.
5	Durability – the amount of time during which a food can be safely stored and eaten.
6	Endothermic process of changing the state of a food from solid to liquid or hard to soft by changing temperature it is stored at.
7	Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
8	Perishable food product usually associated with food poisoning – the only one which should not be eaten after the best before date.
9	Range of temperatures at which the growth of microorganisms is the fastest, usually between 5 and 20 degrees Celsius.
10	Storing food at temperatures below 0 degrees Celsius, in order to stop bacterial growth and preserve nutritional value.
11	Storing food at temperatures between 0 and 5 degrees Celsius, usually in a fridge or cooling cabinet.
12	Temperature of the air surrounding us, usually considered to be between 20 and 25 degrees Celsius. Dry, sealed food can be safely stored.
13	When a strong smell from one food goes into another, less strongly smelling, food product.

Preparing and cooking food (Match Up)

1	All the actions and procedures taken to ensure that food is not harmful and is secure to eat.
2	Disposable items used to protect a cook's hands.
3	Electronic tool used to measure the temperature inside food.
4	Food products which offer the best conditions for microorganism growth and increase the risk of poisoning or food allergy.
5	Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce in friendly conditions.
6	Habits and actions taken by individuals in order to prevent food contamination or poisoning.
7	Harmful bacteria that cause diseases and poisoning.
8	Harmful substance released by microorganisms and other organisms, usually bitter in taste, which causes poisoning.
9	Item of clothing used to prevent hair from falling into food.
10	Item of clothing used to protect the cook's clothes and body from dirt, stains or damage caused by splattering.
11	Process in which microorganisms are killed, usually with the use of high temperatures or antibiotics.
12	State in which microorganisms' bodily functions are slowed down and all activity is minimised in order to survive unfriendly conditions such as low temperatures and allow for later growth.
13	The number of degrees Celsius or Fahrenheit in the centre of a cooked food product.
14	Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.

INSPECTION COPY

PROTECTED**

Microorganisms, enzymes and food spoilage *(Match Up)*

1	All agents capable of causing diseases, such as bacteria, viruses or parasites.
2	Biologically active, protein-based compounds necessary for conducting many life processes, which act as catalysts in chemical reactions.
3	Effect of enzymatic action which leads to change in colour of a food.
4	Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
5	Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce under unfavourable conditions.
6	Heat treatment applied to vegetables and fruit to prevent browning.
7	High-temperature treatment of food or kitchen utensils in which all microorganisms and spores are killed.
8	Microscopic organisms found everywhere in the environment, on the human body and in food, which can cause food spoilage.
9	Microscopic organisms of various shapes used in food production, which can also cause disease.
10	Microscopic, single-celled fungus used in bread, wine and beer production.
11	Negative change in food properties caused by microorganisms and improper storage conditions.
12	Process conducted by bacteria or yeast in which sugar is turned into carbon dioxide and other products, such as alcohol and lactic acid.
13	Product of yeast fermentation used in wine and beer production.
14	Range of temperature which creates ideal conditions for bacterial growth and increases enzyme activity.
15	Reaction of the body to harmful microorganisms or toxins present in food.
16	Substance or agent which speeds up the rate of a chemical reaction.
17	The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in taste or smell.
18	Tiny fungi used in blue cheese production and which create a furry growth on bread and fruit, causing food to spoil.
19	Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
20	Type of bacteria which do not need oxygen to live.
21	Type of bacteria which need oxygen to live.
22	When bacteria spores become active again, leading to bacterial growth and food spoilage.

INSPECTION COPY

Bacterial contamination *(Match Up)*

1	Bacteria species naturally occurring in the human intestines but which is harmful if eaten.
2	Bacterium commonly found on the skin, which produces toxins and causes food poisoning when
3	Condition caused by eating contaminated food, due to development of pathogenic bacteria or re toxins.
4	Foods which pose the best conditions for microorganism growth and increase the risk of food po refrigerated; for example, raw chicken or eggs.
5	Harmful bacteria that cause diseases and poisoning.
6	Insects or other organisms that cause damage to crops or food supplies.
7	Manifestation of an illness or poisoning which can be observed by the patient.
8	Method of food packaging in which all the air is sucked out of the package before sealing, which oxidation and prolongs shelf life.
9	Method of preserving food by fermentation in a brine or vinegar solution.
10	Milk or another food product which has not been heat treated in any way, which makes it a high- increases the risk of food poisoning.
11	One of the main symptoms of food poisoning, also known as dyspepsia.
12	One of the main symptoms of food poisoning, characterised by increased bowel movements and
13	One of the main symptoms of food poisoning, usually preceded by nausea.
14	Person or animal in which bacteria or parasites are present, but don't cause any illness.
15	Process in which microorganisms are killed, usually with the use of high temperatures or antibac
16	The most common cause of food poisoning in the UK, found in offal and poultry.
17	The most common cause of hospital admissions from food poisoning in the UK, typically associat eggs.
18	Transfer of microorganisms or food particles to another food, which may cause food poisoning c anaphylactic shock.

Food origins (Match Up)

1	A piece of land on which fruit trees are grown.
2	Activity during which people catch and kill wild animals and birds, often with the use of specially designed traps.
3	All animals reared on a farm for meat or other purposes.
4	Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
5	Bringing or transporting goods from another country.
6	Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
7	Chemical, nutrient-rich mixture used to enrich and improve soil quality in order to obtain higher yields.
8	Food characteristic of a given time of year.
9	Food product or farming method produced without the use of any artificial compounds, pesticides or GM feeds or fertilisers.
10	Foods made from animals which were purposely bred in a farm in order to obtain milk, egg, meat or other products.
11	Foods such as mushrooms, herbs, roots and wild fruit which are not farmed but are looked for in the wild.
12	Long, transparent plastic tube used in farming in order to provide warmth to plants and protect them from unfavourable weather conditions.
13	Method of catching oysters, crabs and other sea creatures by pulling a large scoop made of a mesh into the water and lifting it out of the water.
14	Method of egg production in which hens can move freely outside the barn; eggs from such hens are sold as free range.
15	Method of fishing in which a net is pulled through the water or just above the seabed behind one or more boats.
16	Organic material left to decay and used as a natural fertiliser.
17	Part of a DNA molecule which carries specific information, such as the colour of a flower or size of a fruit.
18	Plant growing method in which roots are placed into water instead of soil, used to grow lettuces and other vegetables.
19	Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable characteristics.
20	Spiral molecule locked in the nucleus of a cell, which carries all the information about a person, animal or plant.
21	The idea which advocates humane conditions and treatment for animals.
22	The meat of a deer.
23	The origin of food – place where the food comes from and how it is manufactured.

INSPECTION COPY

PROTECTED**

Food miles, packaging and sustainability (Match Up)

1	Ability to produce sufficient amounts of food, ensuring that the ecosystem remains stable and diverse.
2	Able to be broken down in natural conditions, e.g. by bacteria and pests.
3	All food which has not been eaten for various reasons, and has to be disposed of due to spoilage, date mark or another reason.
4	Amount of CO ₂ released during the production and transportation of a given good, e.g. a food product.
5	CO ₂ , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap heat around the Earth and contribute to global warming.
6	Food assurance scheme which ensures food safety, traceability, environmental protection and animal welfare in the UK.
7	Food product or farming method produced without the use of any artificial compounds, pesticides or GM feeds or fertilisers.
8	Foods characteristic of a given time or year.
9	Invisible, odourless gas produced in large amounts during food production and transportation, contributing to the trapping of warmth around the Earth.
10	Light, white synthetic material which does not decompose and which is used to insulate and protect food.
11	Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
12	Naturally occurring, usually non-renewable reserves of non-organic or organic matter, such as coal, oil and wood.
13	Non-profit organisation or warehouse in which non-perishable, basic foods can be gathered, stored and redistributed free of charge to those in need to prevent food poverty and hunger.
14	Process of turning a used product (e.g. newspaper) into a new one (e.g. toilet paper).
15	Situation in which a person cannot buy sufficient amounts of nutritious, healthy food or cannot afford the desired food due to lack of money.
16	Situation in which the average temperature on Earth rises, causing weather anomalies and melting glaciers.
17	Synthetic, usually elastic compound which is very hard to decompose and which is used to produce packaging.
18	The distance a food has to travel from a farm to the plate of a consumer.

INSPECTION COPY

PROTECTED**

Food security (Match Up)

1	Accidentally catching fish or other animals which weren't intended to be caught.
2	Amount of CO ₂ released during the production and transportation of a given good, e.g. a food product.
3	Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
4	Bringing or transporting goods from another country.
5	Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
6	Chemical substances used to enrich and improve soil quality in order to obtain higher crop yields.
7	CO ₂ , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap heat around the Earth and contribute to global warming.
8	Ethical way of trading between developed and developing countries, which allows fair prices and benefits for both the farmers and farm workers.
9	Ice or snow mass formed at the tops of mountains and near the poles.
10	Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
11	Place where fish are caught or reared, either in the wild or in fish farms.
12	Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable traits.
13	Poor, unindustrialised countries which are attempting to increase their growth rate and quality of life through trading and implementing modern technologies.
14	Situation in which the average temperature on Earth rises, causing weather anomalies and melting of glaciers.
15	State in which a person does not provide sufficient amounts of macro- and micronutrients, often leading to health problems.
16	State in which everybody around the world has a sufficient amount of safe, healthy, nutritious food available.
17	State in which massive rainfall has occurred for a prolonged period of time, causing rivers to leave their banks and swamp the surrounding land.
18	State in which no rainfall has occurred for a prolonged period of time, causing crop failure and other problems with food production or hygiene.
19	State in which too many fish are caught, leading to the extinction of a given shoal or the extinction of a species.
20	The distance a food has to travel from a farm to the plate of a consumer.
21	Variety of species occurring in the environment.

Culinary traditions and cuisines *(Match Up)*

1	A pizza that is folded before cooking.
2	Afternoon nap or rest typical of southern countries such as Spain or Mexico.
3	Britain's most popular traditional hard cheese, made from cow's milk and originating from Somerset.
4	Clay dish with a lid used for prepare traditional Arab meals.
5	Cutlery items used instead of a knife and fork in East Asia.
6	Deep frying pan characteristic of Asia.
7	In Great Britain it is a meal eaten around midday or in the early afternoon, often consisting of salads or other easy-to-make foods.
8	Light meal eaten between lunch and dinner; usually consists of sweet treats and small sandwiches accompanied by a pot of a hot beverage.
9	Light meal eaten usually in the late evening.
10	Meal which is eaten around noon instead of breakfast and lunch.
11	Originating from Italy, a small snack eaten before the main dish to increase the appetite.
12	Round clay oven used for cooking traditional Indian meals.
13	Small snacks or biscuits eaten before noon.
14	Style of cooking characteristic of a country or region, which uses specific ingredients and cooking methods.
15	Style of cooking characteristic of the south of Europe.
16	The main or largest meal of the day; in Great Britain it is usually eaten in the early evening, often in a restaurant on formal occasions.
17	Traditional British meal consisting of sandwiches, cakes or scones and a pot of tea.
18	Traditional dessert characteristic of Greece and Turkey, made from flaky pastry with a filling made from nuts, and soaked in syrup or honey.
19	Traditional Japanese dish made of rice, seaweed and fish or vegetables, dipped in soy sauce or wasabi.
20	Traditional Scottish dish made from offal, oats and herbs sealed in an animal's stomach.
21	Traditional Spanish dish made of rice, vegetables, chicken and seafood, usually served in a shallow pan.

Foods in Wales (Match Up)

1	Also known as bara lawr, it is a paste made of stewed seaweed.
2	Bivalve molluscs, the harvesting of which is limited to 5 kg per person.
3	Meatballs made from pork or lamb meat and offal, with the addition of herbs and breadcrumbs.
4	One of the oldest Welsh apple varieties, it is large, green and tangy in taste.
5	Rich fruit loaf made with honey, dried fruit and tea.
6	Soft, spicy cakes with dried fruits, made of flour, butter and sugar, baked on a stone or griddle.
7	Thick pancake made with buttermilk, served in a stack drizzled with honey.
8	Traditional Welsh dish made of toast with spiced melted cheese, baked together under a grill or in a hot oven.
9	Traditional Welsh soup made from salted bacon or other meat and seasonal vegetables.
10	Vegetarian sausage made of cheese, leek, mustard and breadcrumbs.
11	Welsh casserole made of potatoes, vegetables and meat baked in the oven.
12	Welsh national vegetable, part of many dishes such as soups and stews.
13	White, crumbly cheese made from cows milk, also known as one of 'The Crumblelies'.

Food production (Match Up)

1	A type of fibre which occurs naturally in fruit and which acts as a gelling agent.
2	Acid produced from milk sugar during fermentation of milk.
3	Coagulated milk – one of the steps of cheese production.
4	Disaccharide which occurs naturally in milk and which is transformed into acid during milk fermentation.
5	Early processes in which food is turned from raw produce into ingredients for an edible, saleable product.
6	Food preservation method involving the use of nitrates, salt, sugar and sometimes smoking, usually for meats or fish.
7	Freezing food and removing moisture afterwards under pressure to enhance shelf life without affecting the nutritional value of a food.
8	Furry microorganism which is used in blue cheese production and which causes bread and fruit to go mouldy.
9	Gathering the crops from a field or orchard.
10	Heat treatment of milk and meat preserves in which the food is heated to 130°C for 30 minutes to kill bacteria and spores and significantly increase the shelf life of the finished product.
11	Live bacteria added to pasteurised milk to begin the process of fermentation during cheesemaking.
12	Milky liquid, a by-product of cheese production, drained from the cheese and used as a beverage or animal feed.
13	Net-like protein in wheat, rye and barley, responsible for the soft, springy texture of bread.
14	Pressing milk through very fine membranes in order to remove bacteria.
15	Process of decreasing the amount of fat in milk.
16	Process of decreasing the size of fat particles in milk by pressing them through tiny holes to obtain a stable emulsion.
17	Process of gently heating a liquid or a food product to 72°C in order to kill harmful bacteria and make it safe to eat.
18	Processes which affect food's properties or turn it into a different product.
19	Pulverising – turning grain into powder.
20	Raw, unrefined food, usually freshly harvested.
21	Transparent, tasteless substance derived from collagen, used as a gelling agent.
22	Turning milk into yoghurt or cheese with the use of bacteria.
23	Various bacteria species which are beneficial for health and useful in food production.

Technology and food modifications (Match Up)

1	A disease caused by vitamin B12 deficiency, in which red blood cells cannot be built properly.
2	A mineral added to plain flour by law to prevent anaemia.
3	A mineral added to plain flour by law to prevent rickets and osteoporosis.
4	A vitamin added to plain flour by law to reduce the risk of pellagra and other effects of its deficiency.
5	A vitamin added to plain flour by law to restore its levels lost during milling, the deficiency of which causes beriberi disease.
6	Addition of nutrients to a given product to improve or restore its nutritional value.
7	Additive used to maintain a food's chemical structure.
8	Agent used to change or enhance the taste and smell of food.
9	Chemical substances containing nitrogen, used in the production of cured meats to prevent the growth of <i>Clostridium botulinum</i> bacteria and improve the colour of the final product.
10	Condition in which blood vessels of the heart are narrowed due to cholesterol plaque accumulation, increasing the risk of heart attack.
11	Fatty substance which does not occur in vegetable fats, responsible for many diet-related conditions.
12	Group of people who, due to their dietary restrictions, are at increased risk of developing vitamin deficiencies and anaemia.
13	Kind of flour which does not have to be fortified because its nutritional value has not been affected by processing.
14	Kind of milk which has to be fortified by law due to its low fat content.
15	Naturally occurring molecules found in plant substances which have the potential to lower blood cholesterol levels and decrease the risk of heart failure.
16	Obligatory – necessary to add to a food product by law.
17	Pigment – agent used to change or enhance the visual aspects of food.
18	Soft, spreadable mixture made of hydrogenated vegetable oils, used instead of butter, and fortified with vitamins A and D by law.
19	Substance added to fat spreads and skimmed milk by law.
20	Substance used to improve the texture of food and prevent separation of ingredients.

Sensory perception *(Match Up)*

1	Actions taken to make sure all tasters have the same settings and instructions, in order to obtain results.
2	Cell located in the skin and other organs, specialised in conducting stimuli to the brain.
3	Desire to eat a specific food product, as opposed to hunger.
4	One of the features of foods – the smell.
5	One of the five senses, which allows you to assess whether a food looks appetising or not.
6	Piece of bread or wafer that is neutral in taste and that is used during food tasting to serve spread.
7	Properties and aspects of food which are perceived via the senses, especially taste and smell.
8	Sensory test used to assess which one of two samples is liked more by the person doing the tasting.
9	Specialised receptors localised on the tongue which are responsible for recognising flavours.
10	The combined sensation of taste, smell and mouthfeel.
11	The meaty, savoury taste.
12	The system used for recognising aromas.
13	The tissue which covers all of the inner organs, such as the digestive tract.

INSPECTION COPY

Factors which influence food choice (Match Up)

1	A method of expressing an individuals physical activity as a number, used to indicate the amount required for activities such as running, walking and sleeping.
2	All actions, traditions, ideas or beliefs characteristic of a country, region or ethnic group.
3	Describes food that is characteristic of a given time of year.
4	Eating a balanced diet and choosing ingredients carefully.
5	Habits and actions of an individual – the way a person lives.
6	List of ingredients and cooking instructions necessary to obtain a given dish.
7	Person who buys and eats foods – a client.
8	Situation in which food is present in the market and affordable for the buyers, thanks to modern methods, storage system improvements and imports.
9	The amount of money a family has available to spend on food or other goods, after all the taxes have been subtracted.
10	The cost of food – the amount of money one has to pay to buy the food.
11	The influence of a group of people of one's own age, which may affect one's food choices.
12	Unusual or particularly important event; cause for celebration and enjoyment, during which festive drinks are consumed.

Food choices (Match Up)

1	A protein present in wheat, rye and barley, and which is a cause of food intolerance.
2	Chemical substance occurring in beverages, forbidden in many religions.
3	Disease in which gluten cannot be digested and a gluten-free diet has to be followed for the person's life.
4	Ethical way of trading between developed and developing countries, which allows fair prices and protects the farmers and farm workers.
5	Food product or farming method produced without the use of any artificial compounds, pesticides, antibiotics, GM feeds or fertilisers.
6	Foods and other goods which are permissible for Jews.
7	Foods and other goods which are permissible for Muslims.
8	Hindu festival of lights, celebrated in autumn.
9	In Islam, a month-long fasting period during which nothing can be eaten or drunk from sunrise to sunset.
10	Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable characteristics.
11	Severe, life-threatening allergic reaction to food or other factors.
12	The enzyme which breaks down milk sugar in the small intestine.
13	The meat derived from a commonly reared animal, forbidden in many religions, such as Islam or Judaism.
14	The negative reaction of the digestive system to a food ingredient, often manifesting as stomach pain, bloating or diarrhoea.
15	The principle of humane treatment and conditions for animals.
16	The reaction of the immune system to a food ingredient, which may lead to anaphylactic shock.
17	The sugar naturally present in milk and one of the most common causes of food intolerance.

INSPECTION COPY

Food labelling and marketing influences (Match Up)

1	Amount of macro- and micronutrients present in a given food, ingredient or meal.
2	British government agency responsible for protecting public health in relation to food.
3	Date mark which applies to food quality, usually used for dry foods such as biscuits or pasta.
4	Date mark which applies to food safety, after which the food cannot be eaten any more, usually for unprocessed foods.
5	Group of people at whom an advertisement or product is aimed.
6	Marketing technique designed to attract people into buying a given product by offering another same product for free.
7	Marketing technique in which stands containing sweets or other rather expensive, non-staple food are located near checkout counters.
8	Marketing technique in which two or more products bought together are cheaper than when bought separately.
9	Methods and techniques designed to increase sales and encourage people to buy specific items or brands.
10	Obligatory – necessary to include on a food label.
11	One of the mandatory elements of a food label, in which all the contents of the food are listed in order.
12	Reduction in price.
13	Statement on a food label indicating that consumption of a given food or an ingredient it contains is advantageous for health.
14	Statement on a food label indicating the presence of a given ingredient, usually added for health reasons.
15	Substances or ingredients present in a food which may pose a possible danger to someone who is allergic or sensitive or susceptible to them.
16	The origin of food – place where the food comes from.
17	The use of a brand name or product in a popular TV programme, series or show.

Macronutrients: proteins (Table Fill)

Long chains of amino acids that are the building blocks of the body, support growth and development, and make up 15% of a balanced diet.
Type of protein in which some of the essential amino acids are in low amounts or lacking; usually of plant origin.
Type of protein in which all essential amino acids are present in the correct amounts; usually of animal origin.
A process that happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
Combining two or more low biological value proteins in a meal to produce a high biological value meal.
Protein-rich products made without the use of animal-derived ingredients.
Protein-rich product made by <i>Fusarium venenatum</i> fungi.
What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.
Nitrogen-based molecules that bind together to form a chain of peptides.
Amino acids which cannot be produced by the human body from scratch and have to be provided as a part of a healthy diet.
Amino acids which can be built by the human body from available resources.
Type of bean rich in high biological value protein, used for manufacturing many other products, such as flour, oil, sauce or cheese-like products.
Tiny, easy-to-digest, gluten-free grains originating from South America, rich in carbohydrates, protein and fibre, and used as a protein alternative.
Condition caused by prolonged deficiency of protein, occurring especially in developing countries and characterised by swelling of the stomach.
A by-product of extracting oil from soya beans, usually in the form of chunks.
Traditional Japanese paste made of fermented soya, used for sauces and spreads.

Macronutrients: fats, oils and lipids (Table Fill)

An energy-dense macromolecule built from glycerol and three chains of acids, necessary for building hormones and insulating the body.
Type of fat in which all the chemical bonds are single.
Type of fat in which one or more double chemical bonds are present.
Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients.
Type of fat where more than one double chemical bond is present in the fatty acid chain.
Type of fat where only one double chemical bond is present in the fatty acid chain.
Type of fats which are produced as a result of heating oils to high temperatures for a long time.
Connective tissue whose main function is to store energy, and insulate and cushion organs.
A mixture of oil and water.
An oily fish which is rich in essential fatty acids, characterised by its pink flesh.
Visible fat derived from pigs.
Visible fat surrounding the loins and kidneys of cows and sheep, high in saturated fats and characteristic of traditional British cuisine.
The only animal-derived fat which is liquid at room temperature.
The chemical name for a fat molecule.
Three long hydrocarbon chains attached to a glycerol particle to form a molecule of fat.
Fatty substance necessary for building cell membranes and bile in the gall bladder.
Low-density fraction of cholesterol which transports fats around the body and to the cells.
High-density fraction of cholesterol which transports fats from the blood to the liver, and lowers blood cholesterol levels.
Fatty acids which cannot be built by the human body from scratch and have to be provided as a part of a healthy diet.
Group of chemical substances which include fatty acids, triglycerides, waxes and sterols, and which are insoluble in water.
The density or energy content of calories derived from a given food, measured in kilojoules or kilocalories.
The process of adding hydrogen atoms to a triglyceride to change its texture from liquid to solid.
Chronic disease characterised by high blood sugar levels, often developing as a result of high fat intake and obesity.

Macronutrients: carbohydrates (Table Fill)

Large organic macromolecules produced by plants during photosynthesis, and which include sugars, starch and fibre.
Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.
Organic macromolecules produced by plants, bound into long chains in order to store energy for later.
Substance occurring in plant cells only, usually indigestible for humans but necessary for maintaining health.
Carbohydrates built from one molecule only.
Carbohydrate which is built from large number of molecules bound together into long chains.
Simple sugar which is a main source of energy for all of the cells around the human body.
Disaccharide present in milk.
Sugars added to food products, as opposed to those naturally occurring in foods.
Polysaccharide stored in the liver and muscle cells which is an emergency source of energy.
Type of fibre which absorbs water and enhances bowel movements, usually in the form of cellulose or lignin.
Type of fibre which swells in the stomach giving the feeling of satiety, usually in the form of pectin or gum.
Carbohydrates built from two particles of sugars, examples of which are lactose and sucrose.
A simple sugar built from five atoms of carbon, naturally occurring in fruit.
Flour made from whole grains, without separating the bran.
Type of soluble fibre, present in fruit, which acts as a gelling agent.
Condition in which enamel is damaged by bacteria, causing pain and trouble eating.
Sugars that occur naturally in food products, as opposed to free sugars.

INSPECTION COPY

PROTECTED**

Micronutrients: vitamins (Table Fill)

Organic molecules needed in very small amounts, usually provided by the diet but some can also be produced in the body.
Form of vitamin A found in animal-derived foods.
Form of vitamin A found in fruit and vegetables.
Eyesight condition caused by vitamin A deficiency.
Childhood disease caused by an imbalanced, micronutrient-deficient diet.
Condition in which bones lose their density and become fragile and easy to break.
The organ which produces cholecalciferol in response to exposure to sunlight.
A pill or capsule taken to top up micronutrient levels in the body and improve overall health.
The chemical name for vitamin B1, deficiency of which causes beriberi disease.
The chemical name for a water-soluble vitamin which is crucial for releasing energy from foods (vitamin B2).
The chemical name for vitamin B3, necessary for releasing energy from food, found in lean meat, eggs and milk.
The chemical name for vitamin B9, crucial for proper development of the spinal cord and for the production of red blood cells.
Condition caused by folate deficiency during the prenatal period.
Disease caused by thiamine deficiency, symptoms of which include weakening of the muscles leading to paralysis.
Type of anaemia caused by vitamin B12 deficiency, as opposed to iron deficiency anaemia.
A group of people whose dietary restrictions may lead to cobalamin deficiency.
Disease caused by vitamin C deficiency, the main symptoms of which include receding and bleeding gums, and tooth loss.
Disease caused by niacin deficiency, characterised by sensitivity to sunlight.
The chemical name for vitamin B12, found mainly in meat, offal and egg yolk.
The chemical name for vitamin B6, found mainly in fruit and vegetables, such as potatoes, blueberries and cheese.
The chemical name for vitamin D, present in large amounts in milk, dairy products and oily fish, and also produced in the skin.

Micronutrients: minerals and water (Table Fill)

Childhood disease caused by an imbalanced diet which is deficient in vitamin D and calcium.
Condition in adults in which bones lose their density and become fragile and easy to break.
Condition caused by improper fluoride intake and bad mouth hygiene, where enamel becomes damaged by acids and bacteria.
The hardest tissue in the human body, which forms the external part of the teeth.
Products made from milk, often high in calcium.
Condition caused by a deficiency of micronutrients, in particular iron, vitamin B12 and folate, characterised by low red blood cell level.
Process in which drinking water is enriched in fluoride.
Small gland in front of the neck which produces hormones necessary for proper metabolism.
Condition caused by iodine deficiency, symptoms of which include swelling of the neck and changes in metabolism.
Red pigment in blood cells, built from four peptide chains attached to iron atoms, responsible for transporting oxygen in the body.
Invertebrate marine organisms used as food which is rich in protein and iodine.
State caused by excessive loss and insufficient replenishment of water, usually as the result of excessive sweating or exaggerated physical activity.
Serious condition in which the body cannot cool down any more and gets so hot that it becomes dangerous, e.g. as the result of very hot weather.
Liquid, salty secretion from glands located mainly in the armpits and from skin pores all over the body.
Function of water whereby harmful substances are removed from the body.
Chemical element found in milk, dairy products and bony fish, necessary for the proper development and growth of bones and teeth.
Element necessary for building red blood cells, which is easily ingested from meat and eggs but which is harder to ingest from plant-derived foods.
Chemical trace element necessary for the proper development of tooth enamel.
Trace element necessary for building thyroid hormones which regulate the rate of metabolism in the body.
Inorganic chemical element necessary for the body to build cells, conduct electric impulses or build hormones.
Important electrolyte necessary for conducting electrical impulses in the nerves and for lowering blood pressure.
Mineral necessary for the proper performance of the nervous system, preventing involuntary muscle contractions and keeping the heartbeat steady.

Energy requirements of individuals (Table Fill)

Unit used to measure energy, which equals approximately 4,184 joules.
Food which provides many calories in one gram.
Easily available source of energy which is used as a first resort.
Source of energy which is used only if other resources are unavailable.
Process and period of time during which mammary glands produce milk to feed a baby.
Amount of energy necessary for conducting basic life functions, such as breathing or heartbeat.
A method of expressing an individual's physical activity as a number, used to indicate the amount of energy required for activities such as running, walking and sleeping.
Food rich in certain macromolecules, such as carbohydrates or fats, which is consumed mainly to provide power.
Unit used to measure energy, equals to 0.24 kilocalories.
Triglycerides – energy-dense macromolecules present in a range of foods, which should provide up to 35% of daily calorie intake.
Group of macronutrients which should provide around 50% of daily energy intake, usually along with group B vitamins and dietary fibre.
Group of macronutrients which should constitute around 15% of daily calorie intake.
Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients.
What happens to the body when the energy balance is negative – more energy is burnt than is provided in the diet.
Situation in which energy consumption and expenditure are equal.
The way in which a person lives and how active a person is, which significantly affects energy needs.

Balanced diet and guidelines (Table Fill)

Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts to allow proper functioning of the human body.
State in which insufficient amounts of macro- and micronutrients are provided.
Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
Chemical substances necessary for building the body and providing energy, needed in large amounts.
Amount of food eaten in one meal, usually differing depending on a person's age, sex and body size.
Consumption of this type of sugar should be limited to less than 5% of daily calorie intake.
Essential fatty acids are found in large amounts in fish, with double bonds located at the third carbon atom from the end of the fatty acid chain.
Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and lowering the risk of bowel cancer.
Process of supplying a sufficient level of water in the body.
Period in which the body grows rapidly, i.e. in early childhood and during adolescence.
The maximum bone density, reached during adolescence and early adulthood, thanks to calcium accumulation.
Food which provides many calories in one gram.
State in which excessive amounts of macro- or micromolecules are provided, which may lead to many diet-related health conditions.
State in which insufficient macro- and micronutrients are provided, often leading to weight loss and diseases caused by nutrient deficiency.
Sugars added to food products, as opposed to those naturally occurring in foods, consumption of which should be limited to remain healthy.
Sugars naturally occurring in food products, as opposed to free sugars.
Habits and behaviours which include little or no physical activity.
Movement of the body which requires energy expenditure.

Dietary needs and health (Table Fill)

Disease characterised by immune reaction to gluten, leading to damage of the villi in the intestines and nutrient malabsorption.
Condition (usually acquired) in which milk sugar cannot be digested properly, causing bloating, stomach ache and diarrhoea.
Protein which is present in some cereals, such as wheat, rye or barley, and which cannot be eaten by people with coeliac disease.
Glycaemia, or the amount of glucose present in the blood.
Condition in which abnormally high levels of adipose tissue are stored in the body, usually caused by excessive intake of macronutrients.
Ratio of body mass to height squared (kg/m^2), used to assess whether someone's weight is optimal for their height.
Chronic disease caused by impaired performance of insulin, in which abnormally high blood sugar levels occur.
Condition in which heart blood vessels are narrowed by the accumulation of cholesterol plaque, which may lead to heart attack.
Mammary gland tumour, for which risk factors include obesity, drinking alcohol and lack of exercise, as well as hormonal issues and gene mutations.
Tumour of the lower digestive tract, for which risk factors include low consumption of dietary fibre, obesity and unhealthy diet.
Condition in which crystals accumulate in joints, causing swelling, pain and difficulty walking, often as an effect of unhealthy diet and obesity.
State in which blood is not provided to the brain or massive bleeding occurs in the brain, causing damage and death to the brain cells.
Abnormally high blood pressure, characteristic of cardiovascular diseases.
Childhood disease caused by an imbalanced diet which is deficient in vitamin D and calcium.
Condition in which bones lose their density and become fragile and easy to break.
Condition caused by iron deficiency or an inability to properly ingest it.
The body's defence system, protecting it from infections and fighting off bacteria and viruses.
Condition in which veins and arteries are narrowed due to cholesterol plaque accumulation.
The blood vessels which pump blood to the heart.
Simple sugar which is a basic source of energy for all of the cells around the human body.
Important hormone, produced in the pancreas, which is responsible for lowering blood sugar levels.
Overreaction of the immune system to a food product, which makes it one of the most important factors when planning a diet.

Lifestyles and religions (Table Fill)

Type of diet which does not allow consumption of meat, and sometimes other animal-derived foods such as fish, milk or eggs.
Type of diet which does not allow consumption of any animal-derived food products.
Group of people who do not eat meat, but eat eggs and dairy products.
Group of people who do not eat meat or eggs, but eat dairy products.
Meat from animals killed in a ritual way or other food products permitted for consumption by Muslims.
System of beliefs and laws which affect human's lives, from their lifestyle to their food choices.
Person who follows the rules of a religion originating in India.
Person who follows the rules of Islam, a religion established in the seventh century by Muhammad.
Food prepared following the rules of the Jewish food law called kashrut.
Food products which are forbidden for consumption in Islam, such as pork and alcohol.
Person who follows the rules of Judaism, a religion originating in Israel.
Idea, trust or confidence in something, relating to religion, ethics or morality, which can affect people's food choices in a significant way.

Calculate energy and nutritional values of recipes,

Table which shows detailed nutritional information about food products and ingredients.
Amount of macro- and micronutrients present in a given food, ingredient or meal.
Chemical substances necessary for building the body and providing energy, needed in large amounts.
Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
State in which sufficient, appropriate amounts of nutrients and water are provided.
Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts from various sources.
Type of notes or diet in which all foods eaten during a certain period of time are written in order to assess one's diet or eating habits.
Digestible polysaccharide present in rice, bread or pasta, built from long chains of glucose particles joined together.
Substance necessary for proper digestion and bowel movements, decreasing blood sugar levels and lowering the risk of bowel cancer.
Type of freshwater and saltwater fish in which fats are present in large amounts and distributed evenly around their body.
Type of fats in which all the chemical bonds are single, present in large amounts in lard or butter.
Organic macromolecules produced by plants during photosynthesis, present in a range of food products in the form of single or paired molecules.

Reasons why food is cooked (Table Fill)

All actions and procedures taken to ensure that food is not harmful and is secure to eat.
The combined sensation of taste, smell and mouthfeel, which can be greatly altered and improved during cooking.
The consistency of a food product, usually created or altered during cooking.
The smell of food, usually more prominent in hot foods than in cold ones.
Term that refers to whether food is pleasurable and agreeable to the palate.
Food which is in its natural state, before any heat treatment or processing.
Durability – the amount of time during which a food can be safely stored and eaten.
Toxic substances naturally present in foods, which can be deactivated or neutralised during cooking.
Appealing – stimulating craving for a particular food product.
Tiny, omnipresent microorganisms which can cause food poisoning if a food is uncooked or improperly cooked.
Process of softening and improving the texture of meat and poultry by slow-cooking, cutting it into pieces, or using a marinade or a mallet.
Process of breaking down nutrients in the stomach and intestines into a form which can be ingested through the gut wall into the bloodstream.

Heat transfer and cooking methods (Table Fill)

Process in which heat is transferred directly to the food via vibration of the pan's molecules.
Process in which heat is transferred to food indirectly through water or oil, or another medium, such as air.
Process in which heat is transferred to food indirectly by sending heat waves to it.
Electromagnetic waves used in radars, radio transmissions or cooking, which quickly heat up water particles.
Type of invisible radiation emitted by every living organism, used in grills and ovens to transfer heat to the food.
Moist cooking method in which water vapour/steam is used to cook products that are placed above boiling water.
The process in which vegetables are put into boiling water for a short time and then quickly dipped into ice-cold water.
Moist cooking method in which food is simmered below 85 degrees Celsius in a small amount of liquid in order to keep its texture.
Dry cooking method in which food is first sealed in fat and then stewed for a long time.
Fat-based cooking method that originated in Asia and that requires the use of a wok and a small amount of oil or sauce.
Mixture of oil, acid, herbs and flavourings used to flavour and tenderise meat.
When various preparation and cooking methods cause a decrease in the nutritional value of a food product.
The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
The effect on food of exposure to air, leading to a decrease in nutritional value as well as a change in flavour or smell.
Moist cooking method where a large amount of bubbling water at 100 degrees Celsius is used.
Moist cooking method in which food is kept below boiling point (85–99 degrees Celsius) for a long time.
Dry cooking method that involves using an oven without exposing food to the flame.
Dry cooking method that uses a small amount of fat/oil to prevent foods from drying out.
Barbecuing – cooking food on a metal grid, usually in an oven or over an open fire.
Fat-based cooking method which requires a small amount of fat to transfer the heat and seal the surface of a food.
Fat-based cooking method in which food is sunk in a large amount of oil.
Method of transferring thermal energy between two objects without the use of water or oil.
The process in which vegetables are put into boiling water for a short time and then quickly dipped into ice-cold water.

Positive use of microorganisms in dairy products (1)

Coagulated milk – one of the steps of cheese production.
Milky liquid – a by-product of cheese production, drained from the cheese and used as a beverage or animal feed.
Enzyme used to coagulate milk in cheese production.
Bacteria used in cheese production, added to begin the process of milk fermentation.
Sugar which occurs naturally in milk.
What lactose is turned into during bacterial fermentation
Process in which sugar is turned into another substance, used in yoghurt and cheese production.
Invisible and odourless gas produced in sugar fermentation, which helps to obtain fizzy beverages and causes dough to rise.
One of the products of yeast fermentation, used in beer and wine production.
Harmless bacteria used in food manufacturing.
Product of milk fermentation with the use of probiotic bacteria.
Traditional British cheese made with the use of mould.
Traditional French cheese made with the use of mould, with a characteristic white skin.
Single-celled fungus used as leavening agent in the manufacturing of bread.
Spicy sausage originating from Italy, made of fermented beef or pork.
Fermented, cured and smoked spicy sausage originating from Spain.
Alcoholic beverage made from apple juice fermented with yeast.
Popular alcoholic beverage typically made from grapes fermented with yeast.

Functional and chemical properties of ingredients

What happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
What happens to proteins when the molecules aggregate, e.g. as a reaction to salt.
Protein formed when flour is mixed with water, which builds a springy, elastic net and traps air bubbles within the mixture.
Light, delicate structure in which air bubbles are trapped in a liquid.
A solution of acid, oil, herbs and spices, used to prepare a range of meats and tenderise them.
Denaturation of milk proteins in reaction to acid or enzymes used in cheese production.
The process of separating water from overcoagulated, overcoagulated proteins, e.g. in eggs.
One of the proteins present in flour, which, in the presence of water, creates gluten.
One of the proteins present in flour, which, in presence of water, creates gluten.
Reaction of starch to water and heating, in which starch granules swell and break up, used to thicken sauces or cook a risotto.
Reaction of starch to dry heating, in which long chains of starch break down into shorter ones, creating a slight sweet flavour.
Unbranched polysaccharide – one of the compounds which build the chains of starch.
Branched polysaccharide – one of the compounds which build the chains of starch.
Long-chained carbohydrate present in potatoes, rice and pasta, built from amylose and amylopectin.
Process in which fat molecules surround starch and prevent gluten formation, causing pastry to be crumbly.
Process in which air bubbles are trapped in a mixture of fat, leading to cream formation.
Ability of fats to change their physical state at various temperatures, as well as to be easily spread and reshaped.
Process of mixing oil and water together to obtain a stable mixture, used to prepare mayonnaise.
Temperature at which fat transforms into oil.
Molecule which is repelled by water molecules and doesn't mix easily with it.
The effect of plant cell damage, leading to a change in the colour and nutritional value of a fruit or vegetable.
The effect on food of exposure to air, leading to decrease in nutritional value as well as a change in flavour or smell.

Buying and storing food (Table Fill)

Range of temperatures at which the growth of microorganisms is the fastest, usually between 5 and 63 degrees Celsius.
Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
Temperature of the air surrounding us, usually considered to be between 20 and 25 degrees Celsius, in which dry, sealed food can be safely stored.
When a strong smell from one food goes into another, less strongly smelling, food product.
Storing food at temperatures between 0 and 5 degrees Celsius, usually in a fridge or cooling counter.
Storing food at temperatures below 0 degrees Celsius, in order to stop bacterial growth and preserve nutritional value.
Date mark which applies to food quality, usually used for dry foods such as biscuits or pasta.
Date mark which applies to food safety, after which the food cannot be eaten any more; usually used for fresh, unprocessed foods.
A condition that occurs to frozen foods if they are not covered properly and air reaches them, causing oxidation and dehydration.
Defrosting – changing the physical state of food from solid and hard to soft or liquid, caused by increased temperature.
Durability – the amount of time during which a food can be safely stored and eaten.
Perishable food product usually associated with food poisoning – the only one which should not be eaten after the best before date.
Endothermic process of changing the state of a food from solid to liquid or hard to soft by changing the temperature it is stored at.

Preparing and cooking food (Table Fill)

Item of clothing used to prevent hair from falling into food.
Item of clothing used to protect the cook's clothes and body from dirt, stains or damage caused by oil splattering.
Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
Process in which microorganisms are killed, usually with the use of high temperatures or antibacterial sprays.
Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce in more friendly conditions.
Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning or food allergy.
Disposable item used to protect a cook's hands.
Habits and actions taken by individuals in order to prevent food contamination or poisoning.
The number of degrees Celsius or Fahrenheit in the centre of a cooked food product.
All the actions and procedures taken to ensure that food is not harmful and is secure to eat.
Electronic tool used to measure the temperature inside food.
Harmful bacteria that cause diseases and poisoning.
State in which microorganisms' bodily functions are slowed down and all activity is minimised in order to survive unfriendly conditions such as low temperatures and allow for later growth.
Harmful substance released by microorganisms and other organisms, usually bitter in taste, which causes poisoning.

Microorganisms, enzymes and food spoilage (Table Fill)

Negative change in food properties caused by microorganisms and improper storage conditions.
Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
Tiny fungi used in blue cheese production and which create a furry growth on bread and fruit, causing the food to spoil.
Microscopic organisms of various shapes used in food production, which can also cause diseases and food poisoning.
Microscopic, single-celled fungus used in bread, wine and beer production.
Biologically active, protein-based compounds necessary for conducting many life processes, which act as catalysts in chemical reactions.
Microscopic organisms found everywhere in the environment, on the human body and in food which can cause food spoilage.
Process conducted by bacteria or yeast in which sugar is turned into carbon dioxide and other substances, such as alcohol and lactic acid.
Product of yeast fermentation used in wine and beer production.
Type of bacteria which need oxygen to live.
Type of bacteria which do not need oxygen to live.
All agents capable of causing diseases, such as bacteria, viruses or parasites.
Food products which offer the best conditions for microorganism growth and increase the risk of food poisoning, which include raw, moist, protein-rich and ready-to-eat products.
Substance or agent which speeds up the rate of a chemical reaction.
Reaction of the body to harmful microorganisms or toxins present in food.
Range of temperature which creates ideal conditions for bacterial growth and increases enzyme activity.
Effect of enzymatic action which leads to change in colour of a food.
Heat treatment applied to vegetables and fruit to prevent browning.
The effect on food of exposure to air leading to a decrease in nutritional value as well as a change in flavour and smell.
When bacteria become active again, leading to bacterial growth and food spoilage.
High-temperature treatment of food or kitchen utensils in which all microorganisms and spores are killed.
Form of bacteria or fungi resistant to high or low temperatures which can multiply and reproduce in more friendly conditions.

Bacterial contamination (Table Fill)

Foods which pose the best conditions for microorganism growth and increase the risk of food poisoning if not refrigerated; for example, raw chicken or eggs.
Process in which microorganisms are killed, usually with the use of high temperatures or antibacterial sprays.
The most common cause of food poisoning in the UK, found in offal and poultry.
The most common cause of hospital admissions from food poisoning in the UK, typically associated with raw eggs.
Insects or other organisms that cause damage to crops or food supplies.
Manifestation of an illness or poisoning which can be observed by the patient.
Condition caused by eating contaminated food, due to development of pathogenic bacteria or release of toxins.
One of the main symptoms of food poisoning, usually preceded by nausea.
One of the main symptoms of food poisoning, also known as dyspepsia.
One of the main symptoms of food poisoning, characterised by increased bowel movements and pain.
Harmful bacteria that cause diseases and poisoning.
Transfer of microorganisms or food particles to another food, which may cause food poisoning or anaphylactic shock.
Bacteria species naturally occurring in the human intestines but which is harmful if eaten.
Person or animal in which bacteria or parasites are present, but don't cause any illness.
Bacterium commonly found on the skin, which produces toxins and causes food poisoning when eaten.
Milk or another food product which has not been heat treated in any way, which makes it a high-risk food and increases the risk of food poisoning.
Method of preserving food by fermentation in a brine or vinegar solution.
Method of food packaging in which all the air is sucked out of the package before sealing, which prevents oxidation and prolongs shelf life.

Food origins (Table Fill)

The origin of food – place where the food comes from and how is it manufactured.
Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
Chemical, nutrient-rich mixture used to enrich and improve soil quality in order to obtain higher crop yield.
Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable features.
Food product or farming method produced without the use of any artificial compounds, pesticides, antibiotics or GM feeds or fertilisers.
Bringing or transporting goods from another country.
Long, transparent plastic tube used in farming in order to provide warmth to plants and protect them from unfavourable weather conditions.
Plant growing in a container in which roots are placed into water instead of soil, used to grow lettuces or radishes.
Organic material left to decay and used as a natural fertiliser.
Method of egg production in which hens can move freely outside the barn; eggs from such hens are labelled 1.
Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
The idea which advocates humane conditions and treatment for animals.
Spiral molecule locked in the nucleus of a cell, which carries all the information about a person, animal or plant.
Part of a DNA molecule which carries specific information, such as the colour of a flower or size of a fruit.
Foods such as mushrooms, herbs, roots and wild fruit which are not farmed but are looked for in the wild.
Food characteristic of a given time of year.
Method of fishing in which a net is pulled through the water or just above the seabed behind one or more boats.
Method of catching oysters, crabs and other sea creatures by pulling a large scoop made of a metal frame and a net along the seabed.
The meat of a deer.
Activity during which people catch and kill wild animals and birds, often with the use of specially designed traps.
Foods made from animals which were purposely bred in a farm in order to obtain milk, egg, meat or other benefits.
A piece of land on which fruit trees are grown.
All animals reared on a farm for meat or other purposes.

Food miles, packaging and sustainability (Table Fill)

Process of turning a used product (e.g. newspaper) into a new one (e.g. toilet paper).
Invisible, odourless gas produced in large amounts during food production and transportation, capable of trapping warmth around the Earth.
CO ₂ , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap warmth around the Earth and contribute to global warming.
Synthetic, usually elastic compound which is very hard to decompose and which is used to produce food packaging.
Light, white synthetic material which does not decompose easily which is used to insulate and protect goods.
Amount of CO ₂ released during the production and transportation of a given good, e.g. a food product.
The distance a food product has to travel from a farm to the plate of a consumer.
Foods characteristic of a given time of year.
Food assurance scheme which ensures food safety, traceability, environmental protection and animal welfare in the UK.
Ability to produce sufficient amounts of food, ensuring that the ecosystem remains stable and diverse.
Food product or farming method produced without the use of any artificial compounds, pesticides, antibiotics or GM feeds or fertilisers.
Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
Naturally occurring, usually non-renewable reserves of non-organic or organic matter, such as water, coal or wood.
Situation in which the average temperature on Earth rises, causing weather anomalies and melting of glaciers.
Able to be broken down in natural conditions, e.g. by bacteria and pests.
Situation in which a person cannot buy sufficient amounts of nutritious, healthy food or cannot buy the desired food due to lack of money.
Non-profit organisation or warehouse in which non-perishable, basic foods can be gathered, stored and redistributed free of charge to those in need to prevent food poverty and hunger.
All food which has not been eaten for various reasons, and has to be disposed of due to spoilage, an exceeded date mark or another reason.

INSPECTION COPY

Food security (Table Fill)

State in which everybody around the world has a sufficient amount of safe, healthy, nutritious food.
Bringing or transporting goods from another country.
Poor, unindustrialised countries which are attempting to increase their growth rate and quality of life by trading and implementing modern technologies.
State in which a person does not provide sufficient amounts of macro- and micronutrients, often leading to deficiency-related diseases.
Situation in which the average temperature on Earth rises, causing weather anomalies and melting of glaciers.
CO ₂ , methane, nitrous oxide, ozone and water vapour – the gases which have the potential to trap warmth around the Earth and contribute to global warming.
Ethical way of trading between developed and developing countries, which allows fair prices and wages for the farmers and farm workers.
State in which no rainfall has occurred for a prolonged period of time, causing crop failure and major problems with food production or hygiene.
State in which massive rainfall has occurred for a prolonged period of time, causing rivers to leave their beds and swamp the surrounding land.
Ice or snow mass formed at the tops of mountains and near the poles.
Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable features.
Naturally occurring, non-renewable sources of energy which were formed as the result of anaerobic decomposition of organic matter.
Amount of CO ₂ released during the production and transportation of a given good, e.g. a food product.
The distance a food has to travel from a farm to the plate of a consumer.
Chemical substance sprayed on fields and orchards to prevent damage caused by pests.
Chemical substances used to enrich and improve soil quality in order to obtain higher crop yields.
Artificial fishery built in order to protect natural wildlife and achieve food sustainability.
Variety of species surviving in the environment.
Place where fish are caught or reared, either in the wild or in fish farms.
State in which too many fish are caught, leading to the extinction of a given shoal or the extinction of the species.
Accidentally catching fish or other animals which weren't intended to be caught.

Culinary traditions and cuisines (Table Fill)

Style of cooking characteristic of a country or region, which uses specific ingredients and cooking methods.
Britain's most popular traditional hard cheese, made from cow's milk and originating from Somerset.
Meal which is eaten around noon instead of breakfast and lunch.
Light meal eaten usually in the late evening.
The main or largest meal of the day; in Great Britain it is usually eaten in the early evening, often in a restaurant on formal occasions.
In Great Britain it is a meal eaten around midday or in the early afternoon, often consisting of sandwiches, salads or other easy-to-eat foods.
Light meal eaten between lunch and dinner; usually consists of sweet treats and small sandwiches accompanied by a pot of a hot beverage.
Small snacks or biscuits eaten before noon.
Traditional British meal consisting of sandwiches, cakes or scones and a pot of tea.
Afternoon nap or rest typical of southern countries such as Spain or Mexico.
Originating from Italy, a small snack eaten before the main dish to increase the appetite.
Traditional Spanish dish made of rice, vegetables, chicken and seafood, usually served in a shallow frying pan.
Deep frying pan characteristic of Asia.
Cutlery items used instead of a knife and fork in East Asia.
Round clay oven used for cooking traditional Indian meals.
A pizza that is folded before cooking.
Traditional Japanese dish made of rice, seaweed and fish or vegetables, dipped in soy sauce or wasabi paste.
Traditional Scottish dish made from offal, oats and herbs cooked in an animal's stomach.
Style of cooking characteristic of the south of Europe.
Clay dish with a handle used to prepare traditional Arab meals.
Traditional dessert characteristic of Greece and Turkey, made from flaky pastry with a filling traditionally made from nuts, and soaked in syrup or honey.

Foods in Wales (Table Fill)

Rich fruit loaf made with honey, dried fruit and tea.
Vegetarian sausage made of cheese, leek, mustard and breadcrumbs.
Welsh national vegetable, part of many dishes such as soups and stews.
Traditional Welsh dish made of toast with spiced melted cheese, baked together under a grill or in an oven.
Also known as bara lawr, it is a paste made of stewed seaweed.
Traditional Welsh soup made from salted bacon or other meat and seasonal vegetables.
Welsh casserole made of potatoes, vegetables and meat baked in the oven.
Meatballs made from pork, lamb, beef and offal, with the addition of herbs and breadcrumbs.
Soft, spicy cakes with dried fruits, made of flour, butter and sugar, baked on a stone or griddle.
Bivalve molluscs, the harvesting of which is limited to 5 kg per person.
Thick pancake made with buttermilk, served in a stack drizzled with honey.
White, crumbly cheese made from cows milk, also known as one of 'The Crumblies'.
One of the oldest Welsh apple varieties, it is large, green and tangy in taste.

Food production (Table Fill)

Gathering the crops from a field or orchard.
Pulverising – turning grain into powder.
Process of gently heating a liquid or a food product to 72°C in order to kill harmful bacteria and make food safe to eat.
Heat treatment of milk and meat preserves in which the food is heated to 130°C for 30 minutes to kill all bacteria and spores and significantly increase the shelf life of the finished product.
Pressing milk through very fine membranes in order to remove bacteria.
Turning milk into yoghurt or cheese with the use of bacteria.
Various bacteria species which are beneficial for health and useful in food production.
Furry microorganism which is used in blue cheese production and which causes bread and fruit spoilage.
Milky liquid, a by-product of cheese production, drained from the cheese and used as a beverage or animal feed.
Coagulated milk – one of the steps of cheese production.
Freezing food and removing moisture afterwards under pressure to enhance shelf life without affecting nutritional value of a food.
Processes which affect food's properties or turn it into a different product.
Raw, unrefined food, usually freshly harvested.
Early processes in which food is turned from raw produce into ingredients for an edible, saleable food product.
Transparent, tasteless substance derived from collagen, used as a gelling agent.
Process of decreasing the amount of fat in milk.
Process of decreasing the size of fat particles in milk by pressing them through tiny holes to obtain a stable mixture.
Live bacteria added to pasteurised milk to begin the process of fermentation during cheesemaking.
A type of fibre which occurs naturally in fruit and which acts as a gelling agent.
Disaccharide which occurs naturally in milk and which is transformed into acid during milk fermentation.
Acid produced from milk sugar during fermentation of milk.
Net-like protein in wheat, rye and barley, responsible for the soft, springy texture of bread.
Food preservation method involving the use of nitrates, salt, sugar and sometimes smoking, usually applied to meats or fish.

INSPECTION COPY

Technology and food modifications (Table Fill)

Addition of nutrients to a given product to improve or restore its nutritional value.
Obligatory – necessary to add to a food product by law.
Kind of flour which does not have to be fortified because its nutritional value has not been affected by processing.
Kind of milk which has to be fortified by law due to its low fat content.
Soft, spreadable mixture made of hydrogenated vegetable oils, used instead of butter, and fortified in vitamins A and D by law.
A vitamin added to plain flour by law to restore its levels lost during milling, the deficiency of which may cause beriberi disease.
A vitamin added to plain flour by law to reduce the risk of pellagra and other effects of its deficiency.
A mineral added to plain flour by law to prevent anaemia.
A mineral added to plain flour by law to prevent rickets and osteoporosis.
Substance added to fat spreads and skimmed milk by law.
Pigment – agent used to change or enhance the visual aspects of food.
Substance used to improve the texture of food and prevent separation of ingredients.
Agent used to change or enhance the taste and smell of food.
Fatty substance which does not occur in vegetable fats, responsible for many diet-related conditions.
Naturally occurring molecules found in plant substances which have the potential to lower blood cholesterol level and decrease the risk of heart failure.
Additive used to maintain a food's chemical structure.
Chemical substances containing nitrogen, used in the production of cured meats to prevent the growth of <i>Clostridium botulinum</i> bacteria and improve the colour of the final product.
Condition in which blood vessels of the heart are narrowed due to cholesterol plaque accumulation, increasing the risk of heart attack.
Group of people who, due to their dietary restrictions, are at increased risk of developing vitamin B12 deficiency and anaemia.
A disease caused by vitamin B12 deficiency, in which red blood cells cannot be built properly.

Sensory perception (Table Fill)

Cell located in the skin and other organs, specialised in conducting stimuli to the brain.
Properties and aspects of food which are perceived via the senses, especially taste and smell.
Specialised receptors localised on the tongue which are responsible for recognising flavours.
The meaty, savoury taste.
The system used for recognising aromas.
The tissue which covers all of the inner organs, such as the digestive tract.
The combined sensation of taste, smell and mouthfeel.
Sensory test used to assess which one of two samples is liked more by the person doing the tasting.
Actions taken to make sure all tasters have the same settings and instructions, in order to obtain reliable results.
Piece of bread or wafer that is neutral in taste and that is used during food tasting to serve spreads and pastes.
Desire to eat a specific food product, as opposed to hunger.
One of the five senses, which allows you to assess whether a food looks appetising or not.
One of the features of foods – the smell.

Factors which influence food choice (Table Fill)

A method of expressing an individuals physical activity as a number, used to indicate the amount of energy required for activities such as running, walking and sleeping.
Unusual or particularly important event; cause for celebration and enjoyment, during which festive foods and drinks are consumed.
The cost of food – the amount of money one has to pay to buy the food.
Situation in which food is present in the market and affordable for the buyers, thanks to modern farming methods, storage system improvements and imports.
Eating a balanced diet and choosing ingredients carefully
The amount of money a family has available to be spent on food or other goods, after all the taxes have been subtracted.
Habits and activities of an individual – the way a person lives.
List of ingredients and cooking instructions necessary to obtain a given dish.
Describes food that is characteristic of a given time of year.
The influence of a group people of one's own age, which may affect one's food choices.
Person who buys and eats foods – a client.
All actions, traditions, ideas or beliefs characteristic of a country, region or ethnic group.

Food choices (Table Fill)

The meat derived from a commonly reared animal, forbidden in many religions, such as Islam or Judaism.
Chemical substance occurring in beverages, forbidden in many religions.
Foods and other goods which are permissible for Muslims.
Foods and other goods which are permissible for Jews.
Hindu festival of lights, celebrated in autumn.
In Islam, a month-long fasting period during which nothing can be eaten or drunk from sunrise to dusk.
The negative reaction of the digestive system to a food ingredient, often manifesting as stomach cramps or diarrhoea.
The reaction of the immune system to a food ingredient, which may lead to anaphylactic shock.
The sugar naturally present in milk and one of the most common causes of food intolerance.
A protein present in wheat, rye and barley, and which is a cause of food intolerance.
The enzyme which breaks down milk sugar in the small intestine.
Disease in which gluten cannot be digested and a gluten-free diet has to be followed for the person's entire life.
Severe, life-threatening allergic reaction to food or other factors.
The principle of humane treatment and conditions for animals.
Ethical way of trading between developed and developing countries, which allows fair prices and wages for the farmers and farm workers.
Food product or farming method produced without the use of any artificial compounds, pesticides, antibiotics, GM feeds or fertilisers.
Plant or animal whose DNA code has been manipulated in order to obtain or enhance more desirable features.

Food labelling and marketing influences (Table Fill)

Obligatory – necessary to include on a food label.
British government agency responsible for protecting public health in relation to food.
The origin of food – place where the food comes from.
Amount of macro- and micronutrients present in a given food, ingredient or meal.
Marketing technique designed to attract people into buying a given product by offering another pack of the same product for free.
Marketing technique in which two or more products bought together are cheaper than when buying them separately.
Marketing technique in which small portions of sweets or other rather expensive, non-staple food are placed near checkout counters.
The use of a brand name or product in a popular TV programme, series or show.
One of the mandatory elements of a food label, in which all the contents of the food are listed in descending order.
Substances or ingredients present in a food which may pose a possible danger to someone who is especially sensitive or susceptible to them.
Date mark which applies to food safety, after which the food cannot be eaten any more, usually used for fresh, unprocessed foods.
Date mark which applies to food quality, usually used for dry foods such as biscuits or pasta.
Statement on a food label indicating that consumption of a given food or an ingredient it contains is advantageous for health.
Statement on a food label indicating the presence of a given ingredient, usually added for health purposes.
Methods and techniques designed to increase sales and encourage people to buy specific items or foods.
Reduction in price.
Group of people at whom an advertisement or product is aimed.

Macronutrients: proteins

protein	Long chains of amino acids that are the building blocks for growth and development, and make up 15% of a diet.
low biological value	Type of protein in which some of the essential amino acids are in small amounts or lacking; usually of plant origin.
high biological value	Type of protein in which all essential amino acids are present in large amounts; usually of animal origin.
denaturation	A process that happens to proteins at high temperatures, in an acidic environment or as an effect of mechanical action.
protein complementation	Combining two or more low biological value proteins to create a high biological value protein.
protein alternatives	Protein-rich products made without the use of animal products.
mycoprotein	A protein-rich product made by <i>Fusarium venenatum</i> .
coagulation	What happens to proteins when the molecules are exposed to heat or salt.
amino acids	Nitrogen-based molecules that bind together to form proteins.
essential amino acids	Amino acids which cannot be produced by the human body and have to be provided as a part of a healthy diet.
non-essential amino acids	Amino acids which can be built by the human body.
soya	Type of bean rich in high biological value protein. It is used in many other products, such as flour, oil, sauce or tofu.
quinoa	Tiny, easy-to-digest, gluten-free grains originating from the Andes. They are high in carbohydrates, protein and fibre, and used as a staple food.
kwashiorkor	Condition caused by prolonged deficiency of protein in young children in developing countries and characterised by swelling and skin lesions.
textured vegetable protein	A by-product of extracting oil from soya beans, used as a meat substitute.
miso	Traditional Japanese paste made of fermented soya beans, used in soups and spreads.

Macronutrients: fats, oils and lipids

fat	An energy-dense macromolecule built from glycerol and fatty acids, necessary for building hormones and insulin.
saturated fat	Type of fat in which all the chemical bonds are single bonds.
unsaturated fat	Type of fat in which one or more double chemical bonds are present.
obesity	Condition in which abnormally high levels of adipose tissue are in the body, usually caused by excessive intake of macronutrients.
polyunsaturated fat	Type of fat where more than one double chemical bond is present in the acid chain.
monounsaturated fat	Type of fat where only one double chemical bond is present in the acid chain.
trans fats	Type of fats which are produced as a result of hydrogenation at high temperatures for a long time.
adipose tissue	Connective tissue whose main function is to store energy and to cushion organs.
emulsion	A mixture of oil and water.
salmon	An oily fish which is rich in essential fatty acids, particularly omega-3 fatty acids.
lard	Visible fat derived from pigs.
suet	Visible fat surrounding the loins and kidneys of a carcass, rich in saturated fats and characteristic of traditional British cooking.
fish oil	The only animal-derived fat which is liquid at room temperature.
triglyceride	The chemical name for a fat molecule.
fatty acids	Three long hydrocarbon chains attached to a glycerol molecule of fat.
cholesterol	Fatty substance necessary for building cell membranes and the gall bladder.
LDL cholesterol	Low-density fraction of cholesterol which transports cholesterol to and to the cells.
HDL cholesterol	High-density fraction of cholesterol which transports cholesterol from the liver, and lowers blood cholesterol levels.
essential fatty acids	Fatty acids which cannot be built by the human body and therefore to be provided as part of a healthy diet.
lipid	Group of chemical substances which include fatty acids, triglycerides, and which are insoluble in water.
energy	The density or amount of calories derived from a food source, measured in kilojoules or kilocalories.
hydrogenation	The process of adding hydrogen atoms to a triglyceride, converting it from liquid to solid.
type 2 diabetes	Chronic disease characterised by high blood sugar levels, often as a result of high fat intake and obesity.

Macronutrients: carbohydrates

carbohydrates	Large organic macromolecules produced by plants and which include sugars, starch and fibre.
sugar	Organic macromolecules produced by plants during photosynthesis and found in a range of food products in the form of single or double sugars.
starch	Organic macromolecules produced by plants, broken down into glucose to store energy for later.
dietary fibre	Substance occurring in plant cells only, usually in the form of cellulose, which is necessary for maintaining health.
monosaccharides	Carbohydrates built from one molecule only.
polysaccharides	Carbohydrate which is built from large numbers of monosaccharides joined into long chains.
glucose	A simple sugar which is a basic source of energy for the human body.
lactose	Disaccharide present in milk.
free sugar	Sugars added to food products, as opposed to those naturally occurring in foods.
glycogen	Polysaccharide stored in the liver and muscle cells, which can be broken down as a source of energy.
insoluble fibre	Type of fibre which absorbs water and enhances bowel movement, found in the form of cellulose or lignin.
soluble fibre	Type of fibre which swells in the stomach giving a feeling of fullness, usually in the form of pectin or gum.
disaccharides	Carbohydrates built from two particles of sugar joined together, such as lactose and sucrose.
fructose	A simple sugar built from five atoms of carbon, normally found in fruit.
wholemeal	Flour made from whole grains, without separating out the bran or germ.
pectin	Type of soluble fibre, present in fruit, which acts as a thickener.
tooth decay	Condition in which enamel is damaged by bacteria eating.
intrinsic sugars	Sugars that occur naturally in food products, as opposed to those added.

Micronutrients: vitamins

<i>vitamins</i>	Organic molecules needed in very small amount in diet but some can also be produced in the body.
<i>retinol</i>	Form of vitamin A found in animal-derived foods.
<i>beta-carotene</i>	Form of vitamin A found in fruit and vegetables.
<i>night blindness</i>	Eyesight condition caused by vitamin A deficiency.
<i>rickets</i>	Childhood disease caused by an imbalanced, micronutrient diet.
<i>osteoporosis</i>	Condition in which bones lose their density and may break.
<i>skin</i>	The organ which produces cholecalciferol in response to UV light.
<i>supplement</i>	A pill or capsule taken to top up micronutrient levels for general health.
<i>thiamine</i>	The chemical name for vitamin B1, deficiency of which causes beriberi.
<i>riboflavin</i>	The chemical name for a water-soluble vitamin, necessary for energy from foods (vitamin B2).
<i>niacin</i>	The chemical name for vitamin B3, necessary for energy from food found in lean meat, eggs and milk.
<i>folic acid</i>	The chemical name for vitamin B9, crucial for proper development of the spinal cord and for the production of red blood cells.
<i>spina bifida</i>	Condition caused by folate deficiency during the early stages of pregnancy.
<i>beriberi</i>	Disease caused by thiamine deficiency, symptoms include weakness and weakening of the muscles leading to paralysis.
<i>pernicious anaemia</i>	Type of anaemia caused by vitamin B12 deficiency, also known as deficiency anaemia.
<i>vegans</i>	A group of people whose dietary restrictions may lead to certain deficiencies.
<i>scurvy</i>	Disease caused by vitamin C deficiency, the main symptoms are swollen, receding and bleeding gums, and tooth loss.
<i>pellagra</i>	Disease caused by niacin deficiency, characterised by skin lesions.
<i>cobalamin</i>	The chemical name for vitamin B12, found mainly in animal products.
<i>ascorbic acid</i>	The chemical name for vitamin C, found mainly in fruits and vegetables such as potatoes, strawberries or cabbage.
<i>cholecalciferol</i>	The chemical name for vitamin D, present in large quantities in dairy products and oily fish, and also produced in the skin.

INSPECTION COPY

PROTECTED**

Micronutrients: minerals and water

<i>rickets</i>	Childhood disease caused by an imbalanced diet low in vitamin D and calcium.
<i>osteoporosis</i>	Condition in adults in which bones lose their density and become easy to break.
<i>tooth decay</i>	Condition caused by improper fluoride intake and poor oral hygiene. Enamel becomes damaged by acids and bacteria.
<i>enamel</i>	The hardest tissue in the human body, which forms the outer layer of teeth.
<i>dairy</i>	Products made from milk, often high in calcium.
<i>anaemia</i>	Condition caused by a deficiency of micronutrients, particularly iron, vitamin B12 and folate, characterised by low red blood cell counts.
<i>fluoridation</i>	Process in which drinking water is enriched in fluoride to help prevent tooth decay.
<i>thyroid gland</i>	Small gland in front of the neck which produces hormones to regulate proper metabolism.
<i>goitre</i>	Condition caused by iodine deficiency, symptoms include swelling of the neck and changes in metabolism.
<i>haemoglobin</i>	Red pigment in blood cells, built from four peptide chains and iron atoms, responsible for transporting oxygen in the blood.
<i>shellfish</i>	Invertebrate marine organisms used as food which are often high in iodine.
<i>dehydration</i>	State caused by excessive loss and insufficient intake of water, usually as the result of excessive sweating or exposure to heat.
<i>heatstroke</i>	Serious condition in which the body cannot cool itself down, becoming hot that it becomes dangerous, e.g. as the result of dehydration.
<i>sweat</i>	Liquid, salty secretion from glands located mainly in the skin pores all over the body.
<i>detoxication</i>	Function of water whereby harmful substances are removed from the body.
<i>calcium</i>	Chemical element found in milk, dairy products and green leafy vegetables. Essential for the proper development and growth of bones and teeth.
<i>iron</i>	Element necessary for building red blood cells, found in red meat and eggs but which is harder to ingest from plant sources.
<i>fluoride</i>	Chemical trace element necessary for the proper development of enamel.
<i>iodine</i>	Trace element necessary for building thyroid hormones and regulating metabolism in the body.
<i>mineral</i>	Inorganic chemical element necessary for the body to produce electric impulses or build hormones.
<i>potassium</i>	Important electrolyte necessary for conducting nerve impulses and for lowering blood pressure.
<i>magnesium</i>	Mineral necessary for the proper performance of muscles, preventing involuntary muscle contractions and spasms.

Energy requirements of individuals

kilocalorie	Unit used to measure energy, which equals approx 4.2 kilojoules
energy-dense food	Food which provides many calories in one gram
primary source	Easily available source of energy which is used first
secondary source	Source of energy which is used only if other resources are exhausted
lactation	Process and period of time during which mammae feed a baby.
Basal Metabolic Rate	Amount of energy necessary for conducting basic functions such as breathing or heartbeat.
Physical Activity Level	A method of expressing an individual's physical activity to indicate the amount of energy required for activities such as walking and sleeping.
energy source	Food rich in certain macromolecules, such as carbohydrates, consumed mainly to provide power.
kilojoule	Unit used to measure energy, equals to 0.24 kilocalories
fats	Triglycerides – energy-dense macromolecules present in food which should provide up to 35% of daily calorie intake
carbohydrates	Group of macronutrients which should provide approx 50% of calorie intake, usually along with group B vitamins and minerals
proteins	Group of macronutrients which should constitute approx 15% of calorie intake.
obesity	Condition in which abnormally high levels of adipose tissue in the body, usually caused by excessive intake of macromolecules
weight loss	What happens to the body when the energy balance is negative (more energy is burnt than is provided in the diet).
energy balance	Situation in which energy consumption and expenditure are equal
lifestyle	The way in which a person lives and how active they are, which significantly affects energy needs.

Balanced diet and guidelines

balanced diet	Regimen in which all macronutrients and micronutrients are provided in sufficient, appropriate amounts to allow proper functioning of the body.
malnutrition	State in which insufficient amounts of macro- and micronutrients are provided.
micronutrients	Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
macronutrients	Chemical substances necessary for building the body, needed in large amounts.
portion size	Amount of food eaten in one meal, usually different for different age, sex and body size.
free sugars	Consumption of this type of sugar should be limited to reduce the risk of obesity and dental caries.
omega-3	Essential fatty acids, present in large amounts in fish oil. The double bond is located at the third carbon atom from the end of the chain.
dietary fibre	Substance necessary for proper digestion and blood sugar levels and lowering the risk of bowel disease.
hydration	Process of supplying a sufficient level of water to the body.
growth spurt	Period in which the body grows rapidly, i.e. in early adolescence.
peak bone mass	The maximum bone density, reached during adolescence and maintained into adulthood, thanks to calcium accumulation.
energy-dense food	Food which provides many calories in one gram.
overnutrition	State in which excessive amounts of macro- and micronutrients are consumed, which may lead to many diet-related health conditions.
undernutrition	State in which insufficient macro- and micronutrients are consumed, leading to weight loss and diseases caused by nutrient deficiencies.
free sugars	Sugars added to food products, as opposed to those naturally occurring in foods, consumption of which should be limited to reduce the risk of obesity and dental caries.
intrinsic sugars	Sugars naturally occurring in food products, as opposed to those added.
sedentary lifestyle	Habits and behaviours which include little or no physical activity.
physical activity	Movement of the body which requires energy expenditure.

Dietary needs and health

coeliac disease	Disease characterised by immune reaction to gluten, which damages the villi in the intestines and nutrient malabsorption occurs.
lactose intolerance	Condition (usually acquired) in which milk sugar (lactose) cannot be digested, causing bloating, stomach ache and diarrhoea.
gluten	Protein which is present in some cereals, such as wheat, which cannot be eaten by people with coeliac disease.
blood sugar level	Glycaemia, or the amount of glucose present in the blood.
obesity	Condition in which abnormally high levels of adipose tissue in the body, usually caused by excessive intake of macronutrients.
Body Mass Index	Ratio of body mass to height squared (kg/m^2), used to determine if someone's weight is optimal for their height.
diabetes	Chronic disease caused by insufficient performance of the pancreas, so abnormally high blood sugar levels occur.
coronary heart disease	Condition in which heart blood vessels are narrowed by cholesterol plaque, which may lead to heart attack.
breast cancer	Mammary gland tumour, for which risk factors include smoking, alcohol and lack of exercise, as well as hormonal factors.
bowel cancer	Tumour of the lower digestive tract, for which risk factors include consumption of dietary fibre, obesity and unhealthy diet.
arthritis	Condition in which crystals accumulate in joints, causing pain and difficulty walking, often as an effect of unhealthy diet.
stroke	State in which blood is not provided to the brain, usually due to a block in the brain, causing damage and death to the brain tissue.
hypertension	Abnormally high blood pressure, characteristic of many chronic diseases.
rickets	Childhood disease caused by an imbalanced diet, specifically low Vitamin D and calcium.
osteoporosis	Condition in which bones lose their density and become brittle and break.
iron deficiency anaemia	Condition caused by iron deficiency or an inability to absorb iron.
immune system	The body's defence system, protecting it from infection by bacteria and viruses.
atherosclerosis	Condition in which veins and arteries are narrowed by cholesterol accumulation.
coronary arteries	The blood vessels which pump blood to the heart.
glucose	Simple sugar which is a basic source of energy for the cells of the human body.
insulin	Important hormone, produced in the pancreas, which regulates and lowers blood sugar levels.
allergy	Overreaction of the immune system to a food protein. It is one of the most important factors when planning a diet.

Lifestyles and religions

<i>vegetarian</i>	Type of diet which does not allow consumption of animal-derived foods such as fish, milk or eggs.
<i>vegan</i>	Type of diet which does not allow consumption of animal products.
<i>lacto-ovo-vegetarians</i>	Group of people who do not eat meat, but eat eggs and dairy products.
<i>lacto-vegetarians</i>	Group of people who do not eat meat or eggs, but eat dairy products.
<i>halal food</i>	Meat from animals killed in a ritual way or other food products for consumption by Muslims.
<i>religion</i>	System of beliefs and laws which affect human's behaviour and their food choices.
<i>Hindu</i>	Person who follows the rules of a religion originating in India.
<i>Muslim</i>	Person who follows the rules of Islam, a religion founded in the 7th century by Muhammad.
<i>kosher food</i>	Food prepared following the rules of the Jewish religion.
<i>haram food</i>	Food products which are forbidden for consumption by Muslims, such as alcohol and pork.
<i>Jew</i>	Person who follows the rules of Judaism, a religion originating in the Middle East.
<i>belief</i>	Idea, trust or confidence in something, relating to a religion, which can affect people's food choices in a significant way.

Calculate energy and nutritional values of recipes, 1

food table	Table which shows detailed nutritional information for ingredients.
nutritional value	Amount of macro- and micronutrients present in a meal.
macronutrients	Chemical substances necessary for building the body, needed in large amounts.
micronutrients	Chemical substances necessary for the proper functioning of the body, needed in small amounts only.
balance	State in which sufficient, appropriate amounts of nutrients are provided.
healthy diet	Regimen in which the "right" macronutrients and micronutrients, in sufficient appropriate amounts, from various sources are consumed.
dietary diary	Type of notes or calendar in which all foods eaten at a certain time are written in order to assess one's diet or to monitor weight.
starch	Digestible polysaccharide present in rice, bread, potatoes, etc. It consists of long chains of glucose particles joined together.
dietary fibre	Substance necessary for proper digestion and bowel movement, helps to keep blood sugar levels and lowering the risk of bowel cancer.
oily fish	Type of freshwater and saltwater fish in which fat is present in large amounts and distributed evenly around their body.
saturated fats	Type of fats in which all the chemical bonds are saturated with hydrogen atoms. Found in large amounts in lard or butter.
sugar	Organic macromolecules produced by plants during photosynthesis. Found in a range of food products in the form of single or double sugars.

Reasons why food is cooked

<i>food safety</i>	All actions and procedures taken to ensure that food is secure to eat.
<i>flavour</i>	The combined sensation of taste, smell and mouthfeel, which is altered and improved during cooking.
<i>texture</i>	The consistency of a food product, usually created by cooking.
<i>aroma</i>	The smell of food, usually more prominent in hot foods.
<i>palatability</i>	Term that refers to whether food is pleasurable to eat.
<i>raw</i>	Food which is in its natural state, before any heat treatment.
<i>shelf life</i>	Durability – the amount of time during which a food can be eaten.
<i>natural poisons</i>	Toxic substances naturally present in foods, which are neutralised during cooking.
<i>appetising</i>	Appealing – stimulating craving for a particular food.
<i>bacteria</i>	Tiny, omnipresent microorganisms which can cause food poisoning if it is uncooked or improperly cooked.
<i>tenderising</i>	Process of softening and improving the texture of meat by cooking, cutting it into pieces, or using a marinade.
<i>digestion</i>	Process of breaking down nutrients in the stomach and small intestine which can be ingested through the gut wall into the bloodstream.

Heat transfer and cooking methods

conduction	Process in which heat is transferred directly to the pan's molecules.
convection	Process in which heat is transferred to food indirectly through a medium, such as air.
radiation	Process in which heat is transferred to food indirectly through electromagnetic waves.
microwaves	Electromagnetic waves used in microwaves to quickly heat up water particles.
infrared radiation	Type of invisible radiation emitted by every living organism and ovens to transfer heat to the food.
steaming	Moist cooking method in which water vapour/steam is used to cook food above boiling water.
blanching	The process in which vegetables are put into boiling water and then quickly dipped into ice-cold water.
poaching	Moist cooking method in which food is simmered in a small amount of liquid in order to keep its texture.
braising	Dry cooking method in which food is first sealed and then cooked for a long time.
stir-fry	Fat-based cooking method that originated in Asia, using a wok and a small amount of oil or sauce.
marinade	Mixture of oil, acid, herbs and flavourings used to tenderize meat.
vitamin loss	When various preparation and cooking methods lead to the loss of nutritional value of a food product.
enzymatic browning	The effect of plant cell damage, leading to a change in the nutritional value of a fruit or vegetable.
oxidation	The effect on food of exposure to air, leading to a loss of nutritional value as well as a change in flavour or smell.
boiling	Moist cooking method where a large amount of water is used at 100 degrees Celsius is used.
simmering	Moist cooking method in which food is kept below boiling (below 100 degrees Celsius) for a long time.
baking	Dry cooking method that involves using an oven or a grill without the flame.
roasting	Dry cooking method that uses a small amount of oil to prevent food from drying out.
grilling	Barbecuing – cooking food on a special grid, usually over an open fire.
shallow-frying	Fat-based cooking method which requires a small amount of oil, the heat and seal the surface of a food.
deep-frying	Fat-based cooking method in which food is sunk completely in oil.
dry heat	Method of transferring thermal energy between two objects without the use of water or oil.
blanching	The process in which vegetables are put into boiling water and then quickly dipped into ice-cold water.

Positive use of microorganisms in dairy products

<i>curd</i>	Coagulated milk – one of the steps of cheese production.
<i>whey</i>	Milky liquid – a by-product of cheese production and used as a beverage or animal feed.
<i>rennet</i>	Enzyme used to coagulate milk in cheese production.
<i>starter cultures</i>	Bacteria used in cheese production, added to begin fermentation.
<i>lactose</i>	Sugar which occurs naturally in milk.
<i>lactic acid</i>	What lactose is turned into during bacterial fermentation.
<i>fermentation</i>	Process in which sugar is turned into another substance, such as cheese production.
<i>carbon dioxide</i>	Invisible and odourless gas produced in sugar fermentation. It is used to make fizzy drinks and causes dough to rise.
<i>alcohol</i>	One of the products of yeast fermentation, used in brewing.
<i>non-pathogenic</i>	Harmless bacteria used in food manufacturing.
<i>yoghurt</i>	Product of milk fermentation with the use of probiotics.
<i>Stilton</i>	Traditional British cheese made with the use of blue cheese cultures.
<i>Camembert</i>	Traditional French cheese made with the use of white skin.
<i>yeast</i>	Single-celled fungus used as leavening agent in bread making.
<i>salami</i>	Spicy sausage originating from Italy, made of fermented meat.
<i>chorizo</i>	Fermented, cured and smoked spicy sausage originating from Spain.
<i>cider</i>	Alcoholic beverage made from apple juice fermented with yeast.
<i>wine</i>	Popular alcoholic beverage typically made from grapes fermented with yeast.

Functional and chemical properties of ingredients

denaturation	What happens to proteins at high temperatures as an effect of mechanical action.
coagulation	What happens to proteins when the molecules are exposed to salt.
gluten	Protein formed when flour is mixed with water, which forms an elastic net and traps air bubbles within the mixture.
foam	Light, delicate structure in which air bubbles are trapped.
marinade	A solution of acid, oil, herbs and spices, used to tenderise meat.
curdling	Denaturation of milk proteins in reaction to acid production.
syneresis	The process of separating water from overcooked food, e.g. in eggs.
glutenin	One of the proteins present in flour, which, in the presence of water, forms gluten.
gliadin	One of the proteins present in flour, which, in the presence of water, forms gluten.
gelatinisation	Reaction of starch to water and heating, in which starch granules break up, used to thicken sauces or cook a risotto.
dextrinisation	Reaction of starch to dry heating, in which long chains break up into shorter ones, creating a slight sweet flavour.
amylose	Unbranched polysaccharide – one of the components of starch.
amylopectin	Branched polysaccharide – one of the components of starch.
starch	Long-chained carbohydrate present in potatoes, made of amylose and amylopectin.
shortening	Process in which fat molecules surround starch granules, preventing their formation, causing pastry to be crumbly.
aeration	Process in which air bubbles are trapped in a mixture during its formation.
plasticity	Ability of fats to change their physical state at room temperature, as to be easily spread and reshaped.
emulsification	Process of mixing oil and water together to obtain a stable emulsion, e.g. mayonnaise.
melting point	Temperature at which fat transforms into oil.
hydrophobic	Molecule which is repelled by water molecules and does not mix with it.
enzymatic browning	The effect of plant cell damage, leading to a change in the nutritional value of a fruit or vegetable.
oxidation	The effect on food of exposure to air, leading to a change in colour as well as a change in flavour or smell.

Buying and storing food

<i>danger zone temperature</i>	Range of temperatures at which the growth of microorganisms is fastest, usually between 5 and 63 degrees Celsius.
<i>high-risk foods</i>	Food products which offer the best conditions for microorganisms to increase the risk of food poisoning, which include ready-to-eat products.
<i>ambient temperature</i>	Temperature of the air surrounding us, usually between 18 and 25 degrees Celsius, in which dry, sealed food products can grow.
<i>tainting</i>	When a strong smell from one food goes into another food product.
<i>chilling</i>	Storing food at temperatures between 0 and 5 degrees Celsius in a fridge or cooling cabinet.
<i>freezing</i>	Storing food at temperatures below 0 degrees Celsius to stop microbial growth and preserve nutritional value.
<i>best before</i>	Date mark which applies to food quality, usually used for biscuits or pasta.
<i>use by date</i>	Date mark which applies to food safety, after which it should not be eaten any more; usually used for fresh, unprocessed food.
<i>freezer burn</i>	A condition that occurs to frozen foods if they are exposed to air which reaches them, causing oxidation and dehydration.
<i>thawing</i>	Defrosting – changing the physical state of food from solid to liquid, caused by increased temperature.
<i>shelf life</i>	Durability – the amount of time during which a food product can be eaten.
<i>eggs</i>	Perishable food product usually associated with salmonella, a bacterium which should not be eaten after the best before date.
<i>defrosting</i>	Endothermic process of changing the state of a food product from hard to soft by changing the temperature it is stored at.

Preparing and cooking food

hairnet	Item of clothing used to prevent hair from falling
apron	Item of clothing used to protect the cook's clothes or damage caused by oil splattering.
cross-contamination	Transfer of microorganisms or food particles to cause food poisoning or anaphylactic shock.
disinfection	Process in which microorganisms are killed, using temperatures or antibacterial sprays.
spores	Form of bacteria or fungi resistant to high or low temperatures, multiply and reproduce in more friendly conditions.
high-risk foods	Food products which offer the best conditions for increasing the risk of food poisoning or food allergies.
gloves	Disposable items used to protect a cook's hands.
personal hygiene	Habits and actions taken by individuals in order to prevent contamination or poisoning.
core temperature	The number of degrees Celsius or Fahrenheit in the centre of a product.
food safety	All the actions and procedures taken to ensure that food is secure to eat.
food probe	Electronic tool used to measure the temperature of food.
pathogenic bacteria	Harmful bacteria that cause diseases and poisoning.
dormant	State in which microorganisms' bodily functions and activity is minimised in order to survive unfriendly conditions, low temperatures and allow for later growth.
toxin	Harmful substance released by microorganisms, usually bitter in taste, which causes poisoning.

Microorganisms, enzymes and food spoilage

food spoilage	Negative change in food properties caused by poor storage conditions.
cross-contamination	Transfer of microorganisms or food particles to cause food poisoning or anaphylactic shock.
mould	Tiny fungi used in blue cheese production and will grow on bread and fruit, causing the food to spoil.
bacteria	Microscopic organisms of various shapes used in food production, but some also cause diseases and food poisoning.
yeast	Microscopic, single-celled fungus used in bread production.
enzymes	Biologically active, protein-based compounds needed for many life processes, which act as catalysts in chemical reactions.
microorganisms	Microscopic organisms found everywhere in the environment, including the body and in food, which can cause food spoilage.
fermentation	Process conducted by bacteria or yeast in which carbon dioxide and other substances, such as alcohol are produced.
alcohol	Product of yeast fermentation used in wine and spirits.
aerobic	Type of bacteria which need oxygen to live.
anaerobic	Type of bacteria which do not need oxygen to live.
pathogens	All agents capable of causing diseases, such as bacteria, viruses and fungi.
high-risk foods	Food products which offer the best conditions for bacteria to grow, increase the risk of food poisoning, which include ready-to-eat products.
catalyst	Substance or agent which speeds up the rate of a chemical reaction.
food poisoning	Reaction of the body to harmful microorganisms or toxins.
optimal temperature	Range of temperature which creates ideal conditions for an enzyme and increases enzyme activity.
enzymatic browning	Effect of enzymatic action which leads to change in colour of food.
blanching	Heat treatment applied to vegetables and fruit to inactivate enzymes.
oxidation	The effect on food of exposure to air, leading to loss of nutritional value as well as a change in flavour or smell.
germinate	When bacteria spores become active again, leading to food spoilage.
sterilisation	High temperature treatment of food or kitchen equipment so that microorganisms and spores are killed.
spores	Form of bacteria or fungi resistant to high or low temperatures, which multiply and reproduce in more friendly conditions.

Bacterial contamination

perishable foods	Foods which pose the best conditions for microorganisms to grow. These foods increase the risk of food poisoning if not refrigerated properly, such as chicken or eggs.
disinfection	Process in which microorganisms are killed, usually by using high temperatures or antibacterial sprays.
Campylobacter	The most common cause of food poisoning in the UK, typically associated with poultry.
Salmonella	The most common cause of hospital admissions from food poisoning in the UK, typically associated with raw eggs.
pests	Insects or other organisms that cause damage to food.
symptom	Manifestation of an illness or poisoning which can be noticed by the patient.
food poisoning	Condition caused by eating contaminated food, often due to the presence of pathogenic bacteria or release of toxins.
vomiting	One of the main symptoms of food poisoning, usually occurring within 1-6 hours of eating contaminated food.
stomach ache	One of the main symptoms of food poisoning, also occurring within 1-6 hours of eating contaminated food.
diarrhoea	One of the main symptoms of food poisoning, characterised by frequent, loose bowel movements and pain.
pathogenic bacteria	Harmful bacteria that cause diseases and poisoning.
cross-contamination	Transfer of microorganisms or food particles to a clean surface or food, which can cause food poisoning or anaphylactic shock.
E. coli	Bacteria species naturally occurring in the human gut, which can be harmful if eaten.
carrier	Person or animal in which bacteria or parasites can survive and spread, without any illness.
Staphylococcus aureus	Bacterium commonly found on the skin, which produces toxins that cause food poisoning when eaten.
unpasteurised	Milk or another food product which has not been treated with heat, which makes it a high-risk food and increases the risk of food poisoning.
pickling	Method of preserving food by fermentation in a brine solution.
vacuum packing	Method of food packaging in which all the air is removed from the package before sealing, which prevents oxidation and prolongs shelf life.

Food origins

food provenance	The origin of food – place where the food comes from or manufactured.
pesticide	Chemical substance sprayed on fields and orchards to kill pests caused by pests.
fertiliser	Chemical, nutrient-rich mixture used to enrich soil in order to obtain higher crop yield.
genetically modified	Plant or animal whose DNA code has been manipulated to enhance more desirable features.
organic	Food product or farming method produced without synthetic compounds, pesticides, antibiotics or GM feeds.
import	Bringing or transporting goods from another country.
polytunnel	Long transparent plastic tube used in farming in order to grow plants and protect them from unfavourable weather.
hydroponic	Plant growing method in which roots are placed in water and used to grow lettuces or radishes.
compost	Organic material left to decay and used as a natural fertiliser.
free-range	Method of egg production in which hens can move freely and eggs from such hens are labelled 1.
fish farm	Artificial fishery built in order to protect natural fish stocks and sustainability.
animal welfare	The idea which advocates humane conditions and treatment of animals.
DNA	Spiral molecule locked in the nucleus of a cell, which carries genetic information about a person, animal or plant.
gene	Part of a DNA molecule which carries specific information about a flower or size of a fruit.
gathered ingredients	Foods such as mushrooms, herbs, roots and wild fruits which are but are looked for in the wild.
seasonal foods	Food characteristic of a given time of year.
trawling	Method of fishing in which a net is pulled through the seabed behind one or more boats.
dredging	Method of catching oysters, crabs and other sea creatures using a scoop made of a metal frame and a net along the seabed.
venison	The meat of a deer.
hunting	Activity during which people catch and kill wild animals, often with the use of specially bred dogs.
reared ingredients	Foods made from animals which were purposely bred to obtain milk, egg, meat or other benefits.
orchard	A piece of land on which fruit trees are grown.
livestock	All animals reared on a farm for meat or other products.

Food miles, packaging and sustainability

<i>recycling</i>	Process of turning a used product (e.g. newspaper paper).
<i>carbon dioxide</i>	Invisible, odourless gas produced in large amount and transportation, capable of trapping warmth.
<i>greenhouse gases</i>	CO ₂ , methane, nitrous oxide, ozone and water vapour have the potential to trap warmth around the Earth causing warming.
<i>plastic</i>	Synthetic, usually elastic compound which is very strong which is used to produce food packaging.
<i>styrofoam</i>	Light, white synthetic material which does not conduct heat to insulate and protect goods.
<i>carbon footprint</i>	Amount of CO ₂ released during the production and use of a good, e.g. a food product.
<i>food miles</i>	The distance a food has to travel from a farm to a consumer.
<i>seasonal foods</i>	Foods characteristic of a given time of year.
<i>Red Tractor scheme</i>	Food assurance scheme which ensures food safety, environmental protection and animal welfare in the UK.
<i>sustainability</i>	Ability to produce sufficient amounts of food, energy and resources that remains stable and diverse.
<i>organic</i>	Food product or farming method produced without synthetic compounds, pesticides, antibiotics or GM feeds.
<i>fossil fuels</i>	Naturally occurring, non-renewable sources of energy which are the result of anaerobic decomposition of organic matter.
<i>natural resources</i>	Naturally occurring, usually non-renewable resources such as organic matter, such as water, coal or wood.
<i>global warming</i>	Situation in which the average temperature on Earth is rising due to anomalies and melting of glaciers.
<i>biodegradable</i>	Able to be broken down in natural conditions, e.g. compost.
<i>food poverty</i>	Situation in which a person cannot buy sufficient healthy food or cannot buy the desired food due to financial issues.
<i>food bank</i>	Non-profit organisation or warehouse in which food can be gathered, stored and redistributed free of charge to prevent food poverty and hunger.
<i>food waste</i>	All food which has not been eaten for various reasons such as spoilage, an exceeded date mark or an error in production.

Food security

food security	State in which everybody around the world has access to a healthy, nutritious food.
import	Bringing or transporting goods from another country.
developing countries	Poor, unindustrialised countries which are attempting to increase their growth rate and quality of life by trading and importing new technologies.
undernutrition	State in which a person does not provide sufficient energy and/or micronutrients, often leading to deficiency-related health problems.
global warming	Situation in which the average temperature on Earth is increasing due to anomalies and melting of glaciers.
greenhouse gases	CO ₂ , methane, nitrous oxide, ozone and water vapour. They have the potential to trap warmth around the Earth, leading to global warming.
Fairtrade	Ethical way of trading between developed and developing countries that allows fair prices and wages for the farmers and workers.
drought	State in which no rainfall has occurred for a prolonged period, leading to crop failure and major problems with food production.
flood	State in which massive rainfall has occurred for a prolonged period, causing rivers to leave their beds and swamp the surrounding land.
glacier	Ice or snow mass formed at the tops of mountains and moving slowly down the slopes.
genetically modified	Plant or animal whose DNA code has been manipulated to enhance more desirable features.
fossil fuels	Naturally occurring, non-renewable sources of energy that are the result of anaerobic decomposition of organic matter over millions of years.
carbon footprint	Amount of CO ₂ released during the production and consumption of a good, e.g. a food product.
food miles	The distance a food has to travel from a farm to a consumer.
pesticides	Chemical substance sprayed on fields and orchards to kill or control pests caused by insects.
fertilisers	Chemical substances used to enrich and improve the soil to obtain higher crop yields.
fish farm	Artificial fishery built in a pond to protect natural fish stocks and sustainability.
biodiversity	Variety of different species occurring in the environment.
fishery	Place where fish are caught or reared, either in the wild or in a fish farm.
overfishing	State in which too many fish are caught, leading to depletion of the shoal or the extinction of the species.
by-catch	Accidentally catching fish or other animals which were not the target of the catch.

Culinary traditions and cuisines

cuisine	Style of cooking characteristic of a country or region, including ingredients and cooking methods.
Cheddar	Britain's most popular traditional hard cheese, originating from Somerset.
brunch	Meal which is eaten around noon instead of breakfast.
supper	Light meal eaten usually in the late evening.
dinner	The main or largest meal of the day; in Great Britain, often eaten in the early evening, often in a restaurant on formal occasions.
lunch	In Great Britain it is a meal eaten around midday, often consisting of sandwiches, salads or other cold dishes.
afternoon tea	Light meal eaten between lunch and dinner; usually consisting of small sandwiches accompanied by a pot of afternoon tea.
elevenes	Small snacks or biscuits eaten before noon.
afternoon tea	Traditional British meal consisting of sandwiches, scones and a pot of tea.
siesta	Afternoon nap or rest typical of southern countries.
antipasto	Originating from Italy, a small snack eaten before the main meal to stimulate the appetite.
paella	Traditional Spanish dish made of rice, vegetables and meat, usually served in a shallow frying pan.
wok	Deep frying pan characteristic of Asia.
chopsticks	Cutlery items used instead of a knife and fork in East Asian cuisine.
tandoor	Round clay oven used for cooking traditional Indian dishes.
calzone	A pizza that is folded before cooking.
sushi	Traditional Japanese dish made of rice, seaweed and fish, often dipped in soy sauce or wasabi paste.
haggis	Traditional Scottish dish made from offal, oats and spices, cooked in an animal's stomach.
Mediterranean	Style of cooking characteristic of the south of Europe, including the use of olive oil and fresh vegetables.
tagine	Clay dish with a lid used to prepare traditional Moroccan stews.
baklava	Traditional sweetener characteristic of Greece and Turkey, made of layers of phyllo dough filled traditionally with nuts and honey.

Food production

harvesting	Gathering the crops from a field or orchard.
milling	Pulverising – turning grain into powder.
pasteurisation	Process of gently heating a liquid or a food product to kill harmful bacteria and make food safe to eat.
sterilisation	Heat treatment of milk and meat preserves in water at 130°C for 30 minutes to kill all bacteria and spoilage organisms to increase the shelf life of the finished product.
microfiltration	Pressing milk through very fine membranes in order to remove bacteria and spores.
fermentation	Turning milk into yoghurt or cheese with the use of bacteria.
probiotic bacteria	Various bacterial species which are beneficial for human health.
mould	Harmful microorganism which is used in blue cheese but also causes bread and fruit spoilage.
whey	Milky liquid, a by-product of cheese production, which is used as a beverage or animal feed.
curd	Coagulated milk – one of the steps of cheese production.
freeze-drying	Freezing food and removing moisture afterwards to increase shelf life without affecting nutritional value of a product.
secondary processing	Processes which affect food's properties or turn it into a different product.
unprocessed food	Raw, unrefined food, usually freshly harvested.
primary processing	Early processes in which food is turned from raw to become an edible, saleable food product.
gelatin	Transparent, tasteless substance derived from animal collagen.
skimming	Process of decreasing the amount of fat in milk.
homogenisation	Process of decreasing the size of fat particles in milk by passing through tiny holes to obtain a stable mixture.
starter cultures	Live bacteria added to pasteurised milk to begin fermentation during cheesemaking.
pectin	A type of fibre which occurs naturally in fruit and acts as a thickening agent.
lactose	Disaccharide which occurs naturally in milk and is converted to lactic acid during milk fermentation.
lactic acid	Acid produced from milk sugar during fermentation.
gluten	Net-like protein in wheat, rye and barley, responsible for the texture of bread.
curing	Food preservation method involving the use of salt, sugar or sometimes smoking, usually applied to meats or fish.

Technology and food modifications

fortification	Addition of nutrients to a given product to improve its nutritional value.
mandatory	Obligatory – necessary to add to a food product
wholemeal flour	Kind of flour which does not have to be fortified as it has not been affected by processing.
skimmed milk	Kind of milk which has to be fortified by law due to its low fat content.
margarine	Soft, spreadable mixture made of hydrogenated vegetable oil, salt, and fortified in vitamins A and D by law.
thiamine	A vitamin added to plain flour by law to restore the deficiency of which may cause beriberi disease.
niacin	A vitamin added to plain flour by law to reduce the risk of its deficiency.
iron	A mineral added to plain flour by law to prevent iron deficiency.
calcium	A mineral added to plain flour by law to prevent osteoporosis.
vitamin A	Substance added to fat spreads and skimmed milk to prevent deficiency.
colourant	Pigment – agent used to change or enhance the colour of food.
emulsifier	Substance used to improve the texture of food and to mix ingredients.
flavouring	Agent used to change or enhance the taste and smell of food.
cholesterol	Fatty substance which does not occur in vegetable oils and can cause many diet-related conditions.
phytosterols	Naturally occurring molecules found in plant substances which have the potential to lower blood cholesterol level and decrease the risk of heart failure.
stabiliser	Additive used to maintain a food's chemical structure.
nitrites	Chemical substances containing nitrogen, used in curing meats to prevent the growth of <i>Clostridium botulinum</i> and to maintain the colour of the final product.
coronary heart disease	Condition in which blood vessels of the heart are blocked by cholesterol plaque accumulation, increasing the risk of heart failure.
vegans	Group of people who follow a strict dietary restriction of developing vitamin B12 deficiency and anaemia.
pernicious anaemia	A disease caused by vitamin B12 deficiency, in which the blood is not built properly.

Sensory perception

receptor	Cell located in the skin and other organs, specialise in sending information to the brain.
organoleptic qualities	Properties and aspects of food which are perceived by the senses, especially taste and smell.
taste buds	Specialised receptors localised on the tongue which recognise flavours.
umami	The meaty, savoury taste.
olfactory system	The system used for recognising aromas.
epithelium	The tissue which covers all of the inner organs, such as the stomach.
flavour	The combined sensation of taste, smell and mouthfeel.
preference test	A sensory test used to assess which one of two samples is preferred by a person doing the tasting.
fair testing	Actions taken to make sure all tasters have the same conditions and instructions, in order to obtain reliable results.
food carrier	Piece of bread or wafer that is neutral in taste and texture, used for tasting to serve spreads and pastes.
appetite	Desire to eat a specific food product, as opposed to hunger.
sight	One of the five senses, which allows you to assess the appearance of food as appetising or not.
aroma	One of the features of foods – the smell.

Factors which influence food choice

Physical Activity Level

A method of expressing an individual's physical activity level to indicate the amount of energy required for activities such as walking and sleeping.

occasion

Unusual or particularly important event; cause for celebration, enjoyment, during which festive foods and drinks are served.

price

The cost of food – the amount of money one has to pay for it.

food availability

Situation in which food is present in the market for purchase by buyers, thanks to modern farming methods, storage, transport and imports.

healthy eating

Eating a balanced diet with a variety of ingredients.

disposable income

The amount of money a family has available to spend on goods and services after all the taxes have been subtracted.

lifestyle

Habits and actions of an individual – the way a person lives.

recipe

List of ingredients and cooking instructions needed to prepare a dish.

seasonal

Describes food that is characteristic of a given time of year.

peer pressure

The influence of a group of people of one's own age on one's choices.

consumer

Person who buys and eats foods – a client.

culture

All actions, traditions, ideas or beliefs characteristic of a particular ethnic group.

Food choices

pork	The meat derived from a commonly reared animal, but forbidden in many religions, such as Islam or Judaism.
alcohol	Chemical substance occurring in beverages, forbidden in many religions.
halal	Foods and other goods which are permissible for Muslims to eat or drink.
kosher	Foods and other goods which are permissible for Jews to eat or drink.
Diwali	Hindu festival of lights, celebrated in autumn.
Ramadan	In Islam, a month-long fasting period during which Muslims are not to eat or drink from sunrise to dusk.
food intolerance	The negative reaction of the digestive system to a food, often manifesting itself as stomach cramps or diarrhoea.
food allergy	The reaction of the immune system to a food ingredient, which can lead to anaphylactic shock.
lactose	The sugar naturally present in milk and one of the most common causes of food intolerance.
gluten	A protein present in wheat, rye and barley, and a common cause of food intolerance.
lactase	The enzyme which breaks down milk sugar in the digestive system.
coeliac disease	Disease in which gluten cannot be digested and must be avoided for the person's entire life.
anaphylactic shock	Severe, life-threatening allergic reaction to food or other substances.
animal welfare	The principle of humane treatment and conditions for animals.
Fairtrade	Ethical way of trading between developed and developing countries, which allows fair prices and wages for the farmers and workers.
organic	Food product or farming method produced without the use of chemical compounds, pesticides, antibiotics, GM feeds or hormones.
genetically modified	Plant or animal whose DNA code has been manipulated to enhance more desirable features.

Food labelling and marketing influences

mandatory	Obligatory – necessary to include on a food label
Food Standards Agency	British government agency responsible for protection of public health in relation to food.
provenance	The origin of food – place where the food comes from
nutritional value	Amount of macro- and micronutrients present in a food or meal.
BOGOF	Marketing technique designed to attract people by offering another pack of the same product for free
meal deal	Marketing technique in which two or more products are sold cheaper than when buying them separately.
point of sale	Marketing technique in which stands containing promotional items, non-staple foods are located near checkouts
product placement	The use of a brand name or product in a popular TV or film show.
ingredient list	One of the mandatory elements of a food label, in which the ingredients of the food are listed in descending order.
allergens	Substances or ingredients present in a food which may pose a danger to someone who is especially sensitive to them
use by date	Date mark which applies to food safety, after which the food is no longer safe to eat any more, usually used for fresh, unprocessed food
best before date	Date mark which applies to food quality, usually used for biscuits or pasta.
health claim	Statement on a food label indicating that consumption of a particular ingredient it contains is advantageous for health
nutrition claim	Statement on a food label indicating the presence of a nutrient usually added for health purposes.
marketing	Methods and techniques designed to increase sales of a product or to buy specific items or foods.
discount	Reduction in price.
target group	Group of people at whom an advertisement or promotion is aimed
