Teacher's Introduction

This pack contains **four practice paper 2s** for the **AS Edexcel Biology B** specification (2015). The papers and corresponding mark schemes in this pack are modelled on material, provided by Pearson.

Paper 1 is entitled **Core Cellular Biology and Microbiology** and covers:

- Topic 1: Biological Molecules
- Topic 2: Cells, Viruses and Reproduction of Living Things

Paper 2 is entitled **Core Physiology and Ecology** and covers:

- Topic 3: Classification and Biodiversity
- Topic 4: Exchange and Transport

Questions for mock examinations and formative activities are in short supply for this pack can be used for both purposes.

Each practice paper contains a range of short- and long-answer questions, similar to a specimen paper. Papers have been designed to ensure that the mathematical skills in the new syllabus are assessed, and that short- and long-answer questions are included. Detailed mark schemes are included for each paper, but, as always, teachers should use their judgement when marking students' work using these resources.

A specification analysis grid is also included, enabling teachers to identify questions for use in tests and exam technique activities, or as homework assignments.

The author has aimed to include a spread of material from the relevant topics in order to obtain an overview of their students' knowledge and understanding for each unit.

Write-on and non-write-on versions are included in this pack.

I hope you and your students find this pack useful.

Practice Paper 2B

Name	
------	--

Time allowed

1 hour 30 minutes

Instructions

Answer **all** of the questions and use the space provided.

Use black ink. You may use an HB pencil for graphs and diagrams.

Show your working for questions that require calculations.

In questions marked with an asterisk (*), marks are awarded for the quality of your written communication.

Information

The total marks available for this paper is **80**.

Use of an electronic calculator is permitted.

PROTECTED**

Paper 2B

INSPECTION COPY

1. a) Tick the relevant box to indicate the correct answer. Water enters the because the space inside the vascular bundle is the:
- hypertonic
- hypotonic
- isotonic
- apoplastic
- b) Tick the relevant box to indicate the correct answer. Water can travel pathways. The fastest pathway to the Casparian strip is the:
- symplastic
- vacuolar
- hypertonic
- apoplastic
- c) The endodermis can control mineral uptake because active transport is Explain why active transport is selective.

.....

.....

.....

.....

2. Guard cells control the opening and closing of stomata in plant leaves. A stomatal apertures (guard cells and the stomata they surround) in eyepiece units (epu) Each eyepiece unit of the eyepiece graticule measured 0.25 mm.
- a) Calculate the diameter of each stomatal aperture in mm, and use your mean diameter (mm).

Write all answers in the table. Show your working in the space below.

Stomatal aperture and guard cell diameter (epu)	Diameter of the

PROTECTED

b) Explain how an increase in light intensity would affect the diameter of the stomata.

.....

.....

.....

.....

.....

.....

3. a) i) Tick the row in the table that describes capillary structure.

Structural feature	Capillaries
Thick muscle layer	<input type="checkbox"/>
Epithelium	<input type="checkbox"/>
Thin muscle layer	<input type="checkbox"/>
Wide lumen	<input type="checkbox"/>
Pores	<input type="checkbox"/>

ii) Tick the row that describes artery structure.

Structural feature	Artery
Thick muscle layer	<input type="checkbox"/>
Epithelium	<input type="checkbox"/>
Thin muscle layer	<input type="checkbox"/>
Wide lumen	<input type="checkbox"/>
Pores	<input type="checkbox"/>

iii) Tick the row that describes vein structure.

Structural feature	Vein
Thick muscle layer	<input type="checkbox"/>
Epithelium	<input type="checkbox"/>
Thin muscle layer	<input type="checkbox"/>
Wide lumen	<input type="checkbox"/>
Pores	<input type="checkbox"/>

Researchers measured the volume of fluids in and around capillary beds. The results are shown in the table below.

Distance from arteriole (mm)	Volume of tissue fluid surrounding the capillary (mm ³)	Volume of fluid in capillary (mm ³)
0	24	75
0.2	55	44
0.4	71	28
0.6	51	48
0.8 (start of venule)	22	73

6. Mammalian gas exchange occurs in organs called lungs.
- a) Describe and explain three ways in which the gas exchange surface in mammals maximise the gas exchange.

.....

.....

.....

.....

.....

.....

- b) Identify the gas exchange surface in mammalian lungs.

.....

.....

- c) Tick the appropriate box to indicate the correct term for the definition: 'the net movement of molecules from one region to another in one direction at a constant speed'.

- Mass transport
- Mass flow
- Mass diffusion
- Mass movement

- d) In insects, oxygen diffuses directly to the tissues.

Calculate the rate of oxygen transfer from the gas exchange site to the beetle and the field mouse, using the data shown in the graph.

Rate of oxygen transfer =

**COPYRIGHT
PROTECTED**

e) Explain why it is more appropriate to calculate rate of oxygen uptake to mice and beetles.

.....

.....

.....

.....

f) Analyse the data and use your biological knowledge to explain why large to meet their oxygen requirements.

.....

.....

.....

.....

.....

7. Researchers are investigating the uptake of two new potential antibiotics for respiratory tract infections in children. To establish the mode of absorption, intestinal epithelial cells. They exposed the cells to increasing concentrations samples to measure intracellular concentrations after ten minutes. The results are shown in the graph below.

a) Use the data and your biological knowledge to identify the type of transport antibiotic A into the blood from the small intestine.

Explain your choice.

.....

.....

.....

.....

**COPYRIGHT
PROTECTED**

- b) From the current data it is not possible to establish whether antibiotic B enters the cell by simple diffusion or facilitated diffusion.

Describe how the investigation could be extended to establish whether antibiotic B enters the cell by facilitated diffusion or simple diffusion.

.....

.....

.....

.....

.....

.....

.....

When researchers extended their investigation to establish the transport mechanism of antibiotic B, they obtained the graph below.

- c) Use the shape of the graph and your biological knowledge to describe the transport mechanism of antibiotic B. Explain your reasoning.

.....

.....

.....

.....

.....

.....

.....

**COPYRIGHT
PROTECTED**

d) The cell membrane is described as a fluid mosaic model.

Draw the fluid mosaic model of the membrane and clearly label the components involved in the transport of antibiotic B.

e) Explain why the transporter for antibiotic A does not transport antibiotic B.

.....

.....

.....

.....

8. A student wanted to investigate the effect of increasing temperature on the release of a pigment from beetroot cells. She used a cork borer with a diameter of 11 mm to cut a cylinder of beetroot tissue. She then used a ruler to cut the cylinder into five small slices of equal length.

a) Use the formula $2(\pi r^2) + 2(\pi r) \times \text{length}$ to calculate the surface area of each slice.

b) Calculate the volume of each cylinder, using the formula $\pi r^2 \times \text{length}$, then compare the volume ratio.

**COPYRIGHT
PROTECTED**

The student put the five discs in a boiling tube and submerged them in water in a 80 °C water bath for ten minutes, then used a sieve to separate the water from the discs. She then measured the colour of the water using a colorimeter, and recorded the absorbance in a table. She then repeated the experiment at temperatures of 65 °C, 45 °C, room temperature, and 4 °C, using freshly cut discs. She concluded that the absorbance readings increased as the temperature was raised, and that as the temperature increases, the rate of diffusion of beetroot pigment from cells increases'.

c) Describe the improvements that she would need to make to her experiment to make her conclusion valid.

.....

.....

.....

.....

.....

.....

.....

.....

.....

d) State why it is important to control the length and diameter of each disc.

.....

.....

9. The graph below shows oxygen dissociation for two sub-species of deer mice: the high altitude forest deer mouse and the low altitude prairie wood mouse. The forest-dwelling mouse has a different phenotype, exhibiting longer tails, ears, skulls and hind feet than the prairie counterparts.

**COPYRIGHT
PROTECTED**

a) Tick the definition of the term 'oxygen affinity'.

How many oxygen molecules bind to haemoglobin	<input type="checkbox"/>
How readily oxygen molecules separate from haemoglobin	<input type="checkbox"/>
How readily oxygen molecules bind to haemoglobin	<input type="checkbox"/>
How easy it is to separate oxygen from haemoglobin	<input type="checkbox"/>

b) Calculate the percentage increase in the oxygen affinity of forest deer mice compared to prairie deer mouse at 8 kPa of oxygen.

c) Forest and prairie deer mice are not classified as different species and they do not appear to interbreed.

Use your biological knowledge and the information provided to explain why they have a different phenotype and suggest why they do not interbreed.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

The table below shows the saturation of haemoglobin with oxygen and the partial pressure of oxygen in the tissues of mutant and normal forest deer mice during exposure to low oxygen.

Mouse type	kPA of oxygen in tissues at low oxygen kPA	Haemoglobin saturation at low oxygen kPA
'Normal' forest mouse	14	90
'Mutant' forest mouse	8	90

COPYRIGHT PROTECTED

- d) Compare and contrast haemoglobin saturation and oxygen concentration in 'mutant' forest mice to explain why the mutants would have a disadvantage.
